Received 18 January 2011; accepted 19 January 2011

Key indicators: single-crystal X-ray study;  $T = 150\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.022;  $wR$  factor = 0.046; data-to-parameter ratio = 21.2.

The title compound,  $[\text{RuBr}(\text{C}_{10}\text{H}_8\text{N}_2)(\text{C}_6\text{H}_{12}\text{S}_3)]\text{PF}_6$  or  $[\text{RuBr}(\text{bpy})([9]\text{aneS}_3)]\text{PF}_6$  ( $[9]\text{aneS}_3$  is 1,4,7-trithiacyclononane and bpy is 2,2'-bipyridine), exhibits a very similar octahedral coordination geometry for the  $\text{Ru}^{2+}$  atom to that of its  $[\text{RuCl}(\text{bpy})([9]\text{aneS}_3)]^+$  analogue, with only the chloride ligand being substituted by a bromide ligand. The presence of a  $\text{PF}_6^-$  anion (alongside with the coordinated bromide ligand) promotes the existence of an extensive network of weak  $\text{C}-\text{H}\cdots\text{X}$  ( $X = \text{F}, \text{Br}$ ) interactions.

**Comment**

The cytotoxic potential of ruthenium coordination complexes containing 1,4,7-trithiacyclononane ([9]aneS<sub>3</sub>) is under study since 2005 (Bratsos *et al.*, 2008; Serli *et al.*, 2005). We have investigated the cytotoxicity of the [RuCl(glycinate)([9]aneS<sub>3</sub>)] complex on human osteosarcoma and breast cancer cells (Marques, Santos *et al.*, 2009), and the antimicrobial properties of the [RuCl(1,10-phenanthroline)([9]aneS<sub>3</sub>)]Cl complex and its  $\beta$ - and permethylated  $\beta$ -cyclodextrin inclusion compounds (Marques, Braga *et al.*, 2009). We are currently focused on complexes with ([9]aneS<sub>3</sub>)Ru while bearing *N,N*-chelated 2,2'-bipyridine (bpy). Recently, we have successfully isolated the monohydrate form of the [RuCl(bpy)([9]aneS<sub>3</sub>)]NO<sub>3</sub> compound (Fernandes *et al.*, 2010). We wish to report here the structure of [RuBr(bpy)([9]aneS<sub>3</sub>)]PF<sub>6</sub>, isolated as a secondary product from a crystallization batch containing (among other entities) KBr.

The asymmetric unit of the title compound is composed of a whole [RuBr(bpy)([9]aneS<sub>3</sub>)]<sup>+</sup> cation and a charge-balancing PF<sub>6</sub><sup>-</sup> anion. The cation of the title compound shares striking similarities with its [RuCl(bpy)([9]aneS<sub>3</sub>)]<sup>+</sup> analogue (Serli *et al.*, 2005; Goodfellow *et al.*, 1997; Fernandes *et al.*, 2010), with comparable bond lengths and angles of the coordination environments of Ru<sup>2+</sup>. The difference resides in the substitution of the chlorido ligand by a bromido one, with the Ru1—Br1 distance being elongated to 2.5720 (2) Å.

The crystal packing is governed by the need to fill the available space and an overall minimization of the interionic distances (Figure 2). Nevertheless, a handful of weak hydrogen bonding interactions is present, namely C—H groups (both aromatic and methylene) interacting with Br and F of neighbouring ions (not shown; see Table 1 for details). Indeed, the existence of several C—H···F interactions seems to be the structural reason for the absence of the disorder typically associated with the PF<sub>6</sub><sup>-</sup> anion.

**Experimental**

Chemicals were purchased from commercial sources and were used as received without purification.

Solid KBr (0.0945 g, 79.4 µmol, Sigma-Aldrich) was added to an aqueous solution (2 ml) of  $\gamma$ -cyclodextrin (0.130 g, 101 µmol, Wacker). The resulting solution was poured into a sample holder containing [RuCl([9]aneS<sub>3</sub>)bpy]PF<sub>6</sub> (0.0248 g, 40.1 µmol). The mixture was magnetically stirred for 1 h at 60 °C. The total volume was then increased by adding 2 ml of distilled water and the temperature was also raised to 70 °C. The mixture was allowed to stir for another hour, after which it was syringe-filtered (nylon, 0.2 µm). The clear solution was allowed to crystallize by slow cooling to ambient temperature inside a sealed container. Orange crystals of the title compound were formed and isolated after two days.

## Refinement

Hydrogen atoms bound to carbon were placed at their idealized positions and were included in the final structural model in riding-motion approximation with C—H = 0.95 Å (aromatic C—H) and 0.99 Å (—CH<sub>2</sub>—). The isotropic thermal displacement parameters for these atoms were fixed at 1.2× $U_{\text{eq}}$  of the respective parent carbon atom.

## Figures

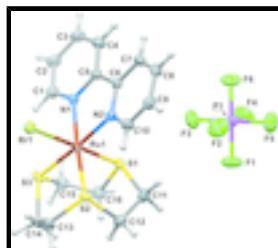

Fig. 1. Asymmetric unit of the title compound, with non-hydrogen atoms represented as displacement ellipsoids drawn at the 70% probability level and hydrogen atoms as small spheres with arbitrary radii. The labelling scheme is provided for all non-hydrogen atoms.

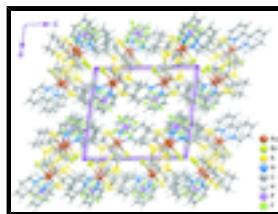

Fig. 2. Crystal packing of the title compound viewed in perspective along the *b* axis.

### Refinement

Refinement on  $F^2$

Primary atom site location: structure-invariant direct methods

Least-squares matrix: full

Secondary atom site location: difference Fourier map

$R[F^2 > 2\sigma(F^2)] = 0.022$

Hydrogen site location: inferred from neighbouring sites

$wR(F^2) = 0.046$

H-atom parameters constrained

$S = 1.06$

$$w = 1/[\sigma^2(F_o^2) + (0.0166P)^2 + 1.1306P]$$

where  $P = (F_o^2 + 2F_c^2)/3$

5736 reflections

$$(\Delta/\sigma)_{\max} = 0.002$$

271 parameters

$$\Delta\rho_{\max} = 0.52 \text{ e \AA}^{-3}$$

0 restraints

$$\Delta\rho_{\min} = -0.63 \text{ e \AA}^{-3}$$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
