Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.007$ Å; R factor = 0.029; wR factor = 0.073; data-to-parameter ratio = 17.3.

In the centrosymmetric dinuclear title compound, $[Pb_2(C_{10}H_6NO_2)_2(CH_3COO)_2(C_2H_5OH)_2]$, one O atom of the carboxylate group of the quinoline-2-carboxylate anion connects the two Pb^{II} atoms. The Pb^{II} atom is surrounded by four O atoms and one N atom in a Ψ -octahedral PbO_4NE geometry (E is the electron lone pair). Two longer $Pb \cdots O$ interactions distort the geometry towards a Ψ -square-anti-prism. Intermolecular O–H···O hydrogen bonds link the molecules.

Comment

A previous study of the methanol adduct of the title dinuclear compound, $[Pb(C_{10}H_6NO_2)(C_2H_3O_2)(CH_3OH)_2]_2$, has found a Ψ -octahedral geometry for the lead(II) atom. Two longer Pb–O interactions distort the geometry towards a Ψ -square-antiprism (Mohammadnezhad *et al.*, 2010). Replacing the methanol solvent system by ethanol leads to the analogous ethanol adduct (Scheme I, Fig. 1), which has a similar structure.

Experimental

Lead(II) acetate (1 mmol) and quinoline-2-carboxylic acid (1 mmol) were loaded into a convection tube; the tube was filled with dry ethanol and kept at 333 K. Colorless crystals were collected from the side arm after several days.

Refinement

H atoms were placed in calculated positions [C—H 0.95 to 0.98, O—H 0.84 Å, $U_{\text{iso}}(\text{H})$ 1.2 to 1.5 $U_{\text{eq}}(\text{C}, \text{O})$] and were included in the refinement in the riding model approximation.

The final difference Fourier map had a peak/hole in the vicinity of Pb1.

Figures

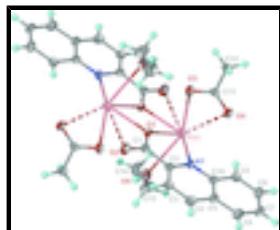

Fig. 1. Anisotropic displacement ellipsoid plot (Barbour, 2001) of the title compound at the 70% probability level; hydrogen atoms are drawn as spheres of arbitrary radius. The longer interactions that raise the coordination number are shown as dashed lines.
