Received 20 December 2010; accepted 21 January 2011

Key indicators: single-crystal X-ray study; $T = 290\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$;
 R factor = 0.028; wR factor = 0.078; data-to-parameter ratio = 14.3.

The title acesulfamate complex, $[\text{Pd}(\text{C}_{30}\text{H}_{22}\text{FO}_2\text{P}_2)_2(\text{C}_4\text{H}_4\text{NO}_4\text{S})]$, contains a four-coordinate Pd(II) ion with the expected, although relatively distorted, square-planar geometry where the four $L-\text{Pd}-L$ angles range from $79.58(8)$ to $102.47(7)^\circ$. The acesulfamate ligand is N-bound to Pd [$\text{Pd}-\text{N} = 2.127(2)\text{ \AA}$] with a dihedral angle of $76.35(6)^\circ$ relative to the square plane. Relatively long phenyl–acesulfamate C–H···O and phenyl–fluorine C–H···F interactions consolidate the crystal packing.

Comment

As thoroughly tested, apparently innocuous foodstuff additives (Lipinsky, 2003), the attraction of the acesulfamate and saccharinate anions as weakly binding ligands for organotransition-metal complexes and components of ionic liquids is obvious. The title complex, abbreviated as Ph{PdF}Ace hereafter, is readily prepared in high yield by a benchtop procedure from its chlorido analogue (Kwan *et al.*, 2007; Hoffman *et al.*, 2009) in an extension of Rh(I) Vaska chemistry (Carter *et al.*, 2004). The presence of the pincer-ligand fluorine atom on the central aryl ring affords a convenient ^{19}F -NMR reporter moiety (whose accuracy may also be corroborated by the two equivalent pendant-arm phosphinite donors by ^{31}P -NMR) for monitoring ligand-substitution chemistry of the acesulfamate anion. A previous study of anion-metathesis equilibria using neutral Ph{PdF} X and N(PPh₃)₂ $^+$ salts has shown anion affinity for Ph{PdF} $^+$ to follow $X^- = \text{chloride} > \text{saccharinate} > \text{trifluoroacetate} > \text{acesulfamate} > \text{nitrato}$ (Wicker *et al.*, 2007). The acesulfamate complex displays a fascinating combination of ^{19}F and ^{31}P couplings to ^{13}C nuclei in the pincer central fluoro-aryl ring, in which J_{F—C} and J_{P—C} correspond visually to their respective doublet and triplet coupling patterns.

A survey of crystal structures of transition-metal acesulfamate complexes shows three principal forms of metal—acesulfamate bonding: (i) monodentate metal to N bond, (ii) monodentate metal to carbonyl O bond (Şahin *et al.*, 2010; Dege *et al.*, 2007), and (iii) metal bonds to both N and carbonyl O in κ^2 -manner (Şahin *et al.*, 2009; Dege *et al.*, 2006; Bulut *et al.*, 2005). When water is present in the crystal, extensive hydrogen bonding occurs. The title compound, a four-coordinate d⁸ complex, has the expected distorted square-planar geometry in which the acesulfamate is N-bound to Pd. The Pd—N distance is 2.127 (2) Å, significantly longer than the Pt—N distance (2.036 (3) Å) in another square-planar d⁸ complex, K₂[*trans*-Pt(Ace)₂Cl₂] (Cavicchioli *et al.*, 2010; Beck *et al.*, 1985), but much shorter than those in divalent late-metal N-acesulfamates with octahedral Jahn-Teller distortion: 2.7175 (16) Å in *trans*-Cu(c—C₆H₁₀-1,2-(NH₂)₂)(Ace)₂ (Şahin *et al.*, 2010) and 2.3180 (19) Å in *trans*-Co(H₂O)₄(Ace)₂ (İçbudak, 2005). The only directly comparable structure above, K₂[*trans*-Pt(Ace)₂Cl₂], probably has a shorter Pt—N distance than that in Ph{PdF}Ace because the *trans*-effect of the fluoroaryl-Pd moiety is stronger than that of N-bound acesulfamate. The almost-planar acesulfamate ring (with the sulfur the only significantly nonplanar atom) in Ph{PdF}Ace is tilted 76.35 (6) $^\circ$ from the Pd(II) coordination plane, whereas the similarly nearly-planar acesulfamate ring in K₂[*trans*-Pt(Ace)₂Cl₂] is nearly perpendicular to the Pt(II) coordination plane.

Experimental

Pd(C₄H₄NO₄S)(C₁₈H₂₂FO₂P₂), abbreviated by Ph{PdF}Ace hereafter, was prepared by stirring Ph{PdF}Cl (25 mg, 0.040 mmol) with silver(I) acesulfamate (1.5 mol equiv.) in benzene (25 mL) at ambient temperature for 24 h. The AgCl precipitate was then removed by filtration, and the solvent was removed on a rotary evaporator to afford a white microcrystalline solid

supplementary materials

(88% yield). Suitable single crystals were prepared by slow evaporation of solvent from a solution in fluorobenzene at 24 °C. The complex was characterized by NMR in CDCl₃.

0 restraints	$\Delta\rho_{\text{min}} = -0.41 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

C18—C13—P1	119.4 (2)		

Hydrogen-bond geometry (\AA , $^\circ$)

$D—\text{H}\cdots A$	$D—\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D—\text{H}\cdots A$
C23—H23 \cdots O3 ⁱ	0.93	2.42	3.284 (4)	155
C16—H16 \cdots O6 ⁱⁱ	0.93	2.47	3.284 (4)	146
C10—H10 \cdots O4 ⁱⁱⁱ	0.93	2.50	3.305 (5)	145
C8—H8 \cdots F1 ^{iv}	0.93	2.48	3.406 (5)	173

Symmetry codes: (i) $x, y-1, z$; (ii) $-x+1, -y+1, -z+1$; (iii) $-x, -y+1, -z$; (iv) $-x+1, -y, -z$.
