Received 19 December 2010; accepted 25 December 2010

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.048;  $wR$  factor = 0.133; data-to-parameter ratio = 16.5.

In the title compound,  $\text{C}_{13}\text{H}_{15}\text{ClN}_2\text{S}$ , the dihydropyrimidine ring is essentially planar, with a maximum deviation from the least-squares plane of 0.122 (3)  $\text{\AA}$  for the unsubstituted olefinic C atom. The dihedral angle between the dihydropyrimidine and benzene rings is 86.62 (13) $^\circ$ . The crystal structure is stabilized by intermolecular N—H $\cdots$ S hydrogen bonds, which form centrosymmetric dimers arranged along the  $c$  axis.

### **1-(3-Chlorophenyl)-4,4,6-trimethyl-3,4-dihdropyrimidine-2(1H)-thione**

**B. M. Yamin and H. F. Salem**

#### **Comment**

The dihydropyrimidinone/thione derivatives are medicinally important due to their therapeutic and pharmacological properties (Kappe, 2000; Alam *et al.*, 2005; Sriram *et al.*, 2006; Leite *et al.*, 2006)).

The title compound (**I**) is a *meta* isomer of the previously reported 1-(4-Chlorophenyl)-4,4,6-trimethyl-3,4-dihdropyrimidine-2(1 H) -thione (Saeed & Bolte,2010). The dihydropyrimidine N1/C1/N2/C2/C3/C4 ring is essentially planar with maximum deviation of 0.122 (3) Å for the unsubstituted olefinic carbon C3 atom compare to that in the *para* isomer where the C4 atom bearing the two methyl substituents deviated by 0.44 (2)%A from the other five almost coplanar atoms (Saeed & Bolte,2010). The dihedral angle between the dihydropyrimidine and benzene ring is 86.62 (13)° (Fig. 1), smaller than that in the *para* isomer of 89.59 (5) Å. The bond lengths and bond angles agree with closely related structures (Ismail *et al.*, 2007; Yamin *et al.*, 2005).

The molecular packing is also characterized by centrosymmetric dimers connected by the N—H.S intermolecular hydrogen bond forming a R<sub>2</sub><sup>2</sup>(8) ring (Etter *et al.*, 1990, Bernstein *et al.*, 1995) and are arranged parallel to the *c* axis (Table 1, Fig 2).

#### **Experimental**

The title compound was prepared by the reaction of thiocynic acid (5.4 mmol) and 3-chloroanaline (5.4 mmol) in acetone. The reaction mixture was stirred for 2–3 h. Then the clear was left for slow evaporation at room temperature. Colourless crystals of 1-(3-Chlorophenyl)-4,4,6-trimethyl -3,4-dihdropyrimidine-2 (1H)-thione were obtained after three days with 80% yield. Anal.Calcd for C<sub>13</sub> H<sub>15</sub> Cl N<sub>2</sub> S: C, 58.53; H, 5.67; N, 10.50; S, 12.02%; found:C, 58.49; H,5.72; N, 10.61; S, 12.14,IR(KBr), v (cm<sup>-1</sup>) 1535 (C=S),1591(C=C),3184 (N—H).

#### **Refinement**

All H atoms attached to C atoms were fixed geometrically and treated as riding with C—H= 0.93 Å(aromatic) or 0.96 Å(methy) with  $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{Caromatic})$  and  $1.5U_{\text{aq}}(\text{Cmethyl})$ . The amino hydrogen atom was located from the difference map and refined freely with  $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{N})$ . In the last cycles of refinement, it was treated as riding on the parent N atom. Both methyl groups attached to C3 display rather elongated ellipsoids however no correct disordered model could be defined and these large ellipsoids may be related to dynamic motion.

| 0 restraints                    | $\Delta\rho_{\min} = -0.14 \text{ e } \text{\AA}^{-3}$                              |

### Special details

**Geometry.** All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
