Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$ ;  $R$  factor = 0.074;  $wR$  factor = 0.165; data-to-parameter ratio = 14.0.

The title compound,  $C_{14}H_{11}N_3O_5$ , crystallized with two independent molecules per asymmetric unit. Each molecule assumes an *E* configuration with respect to the methyldiene unit. Intramolecular O—H···O and N—H···O hydrogen bonds are present in each molecule and they are linked by an O—H···O hydrogen bond. The dihedral angles between the mean planes of the two benzene rings are 4.45 (16) and 1.7 (2) $^\circ$  in the two molecules. The crystal structure is stabilized by intermolecular O—H···O and N—H···O hydrogen bonds.

## 2-Hydroxy-N-(4-hydroxy-3-nitrobenzylidene)benzohydrazide

Z. Zhang

### Comment

Hydrazone compounds have received much attention due to their potential applications in biological chemistry (Ajani *et al.*, 2010; Avaji *et al.*, 2009; Fan *et al.*, 2010; Rasras *et al.*, 2010). As a continuous work on the hydrazone compounds, a new hydrazone compound, *N*-(4-hydroxy-3-nitrobenzylidene)-2-hydroxybenzohydrazide, was prepared and structurally characterized.

The title compound contains two independent molecules (Fig. 1). Each molecule (A abd B) assumes an *E* configuration with respect to the methylidene unit. Intramolecular O—H···O and N—H···O hydrogen bonds are present in the molecules and they are linked by a O—H···O hydrogen bond (Table 1 and Fig. 1). The bond lengths are comparable to those observed in similar hydrazone compounds (Ahmad *et al.*, 2010; Ban, 2010; Ji & Lu, 2010; Shalash *et al.*, 2010). The dihedral angles between the mean planes of the two benzene rings are 4.45 (16) and 1.7 (2)° for molecules A and B, respectively.

The crystal structure is stabilized by intermolecular O—H···O and N—H···O hydrogen bonds (Table 1).

### Experimental

An ethanol solution (50 ml) of 2-hydroxybenzohydrazide (0.01 mol) and 4-hydroxy-3-nitrobenzaldehyde (0.01 mol) was stirred at room temperature for 30 min to give a yellow solution. Yellow block-shaped single crystals, suitable for X-ray diffraction, were formed by slow evaporation of the solution in air.

### Refinement

The amino H-atoms, H1 and H4, were located from a difference Fourier map and were refined with N—H distance restraints of 0.90 (1) Å. The remaining H atoms were positioned geometrically and refined using the riding-model approximation: C—H = 0.93 Å, and O—H = 0.82 Å, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{parent C-atoms})$  and  $1.5U_{\text{eq}}(\text{parent O-atom})$ .

### Figures

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
