Received 20 December 2010; accepted 8 January 2011

Key indicators: single-crystal X-ray study; $T = 299\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.046; wR factor = 0.121; data-to-parameter ratio = 8.1.

In the title molecule, $\text{C}_{10}\text{H}_8\text{FNO}_3$, the dihedral angle between the fluorophenyl group and the essentially planar [within 0.064 (3) Å] $\text{COC}=\text{CCOOH}$ unit, which has a *Z* configuration, is 19.99 (14)°. There is an intramolecular O—H···O bond in the molecule involving the acid —OH group and the adjacent carbonyl O atom. In the crystal, intermolecular N—H···O bonds lead to the formation of polymer chains propagating along [011].

(Z)-3-[(2-Fluoroanilino)carbonyl]prop-2-enoic acid

F. Ali Shah, S. Ali, S. Shahzadi, S. Ahmad and A. Fischer

Comment

Carboxylic acids are good reducing agents and applied as an antioxidant agent and a precursor for the prevention of cancer. Carboxylic acids are used for therapeutic purposes and for other biological applications as well. Those carboxylic acids which contain N atoms are widely used as antibiotics (Gould *et al.*, 1980). Compounds containing NH and carboxyl groups are of great interest for the synthesis of drugs due to their coordination to biological systems. Compounds containing keto, ester and imide are good anti-HCV agents (Chen *et al.*, 2009). Carboxylic acids are also used as anti-inflammatories (Shen & Walford, 1980) and enzymatic inhibitors (Shen & Walford, 1972). We therefore used maleic anhydride to synthesize the title compound, by condensation with 2-fluoroaniline.

The molecular structure of the title compound is illustrated in Fig. 1. The bond distances and angles are close to those observed in similar compounds; 3-[(4-bromoanilino)carbonyl]prop-2-enoic acid (Parvez, Shahid *et al.*, 2004) and 3-[(2,4,6-Trichloroanilino)carbonyl]prop-2-enoic acid (Parvez, Shahzadi *et al.*, 2004). In the molecule there is an intramolecular O—H···O hydrogen bond involving the acid OH group and the adjacent carbonyl O-atom (Table 1). The COC=CCOOH moiety is essentially planar [atoms O1,C7—C10, O2,O3 planar to within 0.064 (3) Å], and has a Z configuration. It makes a dihedral angle of 19.99 (14) Å with the phenyl ring.

In the crystal there are intermolecular N—H···O hydrogen bonds connecting symmetry related molecules yielding chains propagating along [011] (Table 1 and Fig. 2).

Experimental

A solution of maleic anhydride (5 g, 1 mmol) in (300 ml glacial acetic acid) was added to a solution of 2-fluoroaniline (5 ml, 1 mmol) (150 ml glacial acetic acid) in 500 ml beaker at room temperature and the mixture was stirred in fuming hood at room temperature overnight. The light yellow precipitates formed were filtered off, washed with cold distilled H₂O (200 ml) and air dried. The yellow crystals, suitable for X-ray diffraction analysis, were obtained by recrystallization in acetone:n-hexane (1:1).

Refinement

In the final cycles of refinement, in the absence of significant anomalous scattering effects, 719 Friedel pairs were merged and Δf" set to zero. The OH and NH H-atoms were located from a difference Fourier map and were freely refined: O3—H3B = 0.92 (8) Å, N1—H1A = 0.83 (5) Å. The C-bound H-atoms were included in calculated positions and treated as riding atoms: C—H = 0.93 Å with U_{iso}(H) = 1.2U_{eq}(parent C-atom).

supplementary materials

Figures

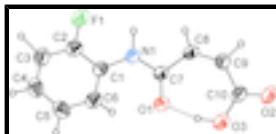

Fig. 1. The molecular structure of the title compound. Thermal ellipsoids are drawn at the 50% probability level. The intramolecular O—H···O hydrogen bond is shown as a dashed line.

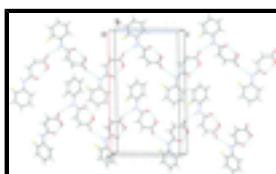

Fig. 2. A view along the *b* axis of the crystal packing of the title compound. The hydrogen bonds are shown as dashed cyan lines (see Table 1 for details).

Data collection

Bruker–Nonius KappaCCD diffractometer	799 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{\text{int}} = 0.066$
graphite	$\theta_{\max} = 27.5^\circ, \theta_{\min} = 5.3^\circ$
φ and ω scans	$h = -24 \rightarrow 26$
7575 measured reflections	$k = -4 \rightarrow 4$
1075 independent reflections	$l = -15 \rightarrow 15$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.046$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.121$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.09$	$w = 1/[\sigma^2(F_o^2) + (0.0562P)^2 + 0.3218P]$ where $P = (F_o^2 + 2F_c^2)/3$

1075 reflections	$(\Delta/\sigma)_{\max} < 0.001$
132 parameters	$\Delta\rho_{\max} = 0.27 \text{ e } \text{\AA}^{-3}$
1 restraint	$\Delta\rho_{\min} = -0.27 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. Bond distances, angles etc. have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
