Received 15 January 2011; accepted 20 January 2011

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$ ;  
 $R$  factor = 0.034;  $wR$  factor = 0.083; data-to-parameter ratio = 17.2.

In the title compound,  $\text{C}_{13}\text{H}_{10}\text{S}_2\text{Te}$ , the dibenzothiophene moiety is almost planar, the maximum atomic deviation being  $0.055(5)\text{ \AA}$ . The two Te—C bonds are nearly perpendicular to each other with a C—Te—C bond angle of  $93.0(2)^\circ$ . An intermolecular C—H···π interaction is present between the methylene group and thiophene ring.

Z.-Q. Liang and X.-T. Tao

### Comment

The design and synthesis of high-performance organic semiconductor materials have been an active topic in the area of field-effect transistors. Recently, organotellurium compounds have received significant attention due to the high charge carrier mobility (Inokuchi *et al.*, 1987). In this paper, we report the synthesis and the crystal structure of the title compound (I).

The asymmetric unit of the title compound is shown in Fig. 1. The dibenzothiophene group possesses perfect planarity: the dihedral angle between the two phenyls is 4.11°. The two Te—C bonds are nearly perpendicular to each other with a C—Te—C bond angle of 93.0 (2)°. In the packing structure (Fig. 2), the molecules are packed into molecular columns along the *a* axis through intermolecular Te···π interactions between the tellurium atom and the phenyl ring (C7—C12). The contact distance of Te···C9 is 3.68 (5) Å, that of Te···C10 is 3.47 (5) Å, and that of Te···C11 is 3.73 (7) Å. These contact distances are significantly shorter than the sum of the van der Waals radii of tellurium and aromatic carbon atoms (Kobayashi *et al.*, 2005). The molecular columns are connected together by intermolecular C···S and S···S interactions. The contact distances of C13···S1 and S1···S2 are 3.43 (5) Å and 3.51 (2) Å, respectively, which are obviously shorter than the sum of the corresponding van der Waals radii. There are no classic hydrogen bonds in the crystal structure.

### Experimental

Addition of a 1.6 *M* solution of n-BuLi in hexane (8.50 ml, 13.6 mmol) to the THF solution of dibenzothiophene (2.50 g, 13.6 mmol) at room temperature under an Ar atmosphere. The reaction mixture was stirred for 2 h, and then tellurium powder (1.70 g, 13.3 mmol) was added. After 3 h, the reaction mixture was poured into a beaker containing 200 ml cold distilled water and oxidized by passing oxygen at a moderate rate for 1 h. The organic solvent was evaporated, and the suspension was extracted with dichloromethane. The organic extracts were washed by brine, and dried by anhydrous CaCl<sub>2</sub>. After the solvent was removed, the crude product was chromatographed on silica gel using petroleum as eluent to give the title compound (0.27 g, yield 5.56%). Single crystals suitable for X-ray diffraction were obtained by very slow evaporation of a chloroform/ethanol solution.

### Refinement

H atoms bonded to C atoms were fixed geometrically and allowed to ride on their attached atoms, with C—H = 0.93–0.97 Å and with *U*<sub>iso</sub>(H) = 1.2*U*<sub>eq</sub>(C). H atom bonded to S atom was refined using a rotating model, with S—H = 1.20 Å and with *U*<sub>iso</sub>(H) = 1.2*U*<sub>eq</sub>(S).

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.034$	H-atom parameters constrained
$wR(F^2) = 0.083$	$w = 1/[\sigma^2(F_{\text{o}}^2) + (0.0502P)^2]$

$S = 0.98$	where $P = (F_o^2 + 2F_c^2)/3$
2509 reflections	$(\Delta/\sigma)_{\max} < 0.001$
146 parameters	$\Delta\rho_{\max} = 0.81 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.55 \text{ e } \text{\AA}^{-3}$
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 975 Friedel pairs Flack parameter: 0.01 (3)

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
