Received 29 December 2010; accepted 16 February 2011

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.018\text{ \AA}$ ; disorder in solvent or counterion;  $R$  factor = 0.072;  $wR$  factor = 0.195; data-to-parameter ratio = 19.8.

The polymeric title compound,  $\{[\text{Bi}(\text{C}_9\text{H}_4\text{O}_6)(\text{NO}_3)_2(\text{C}_{10}\text{H}_8\text{N}_2)(\text{C}_2\text{H}_6\text{OS})] \cdot \text{C}_2\text{H}_6\text{OS}\}_n$ , was obtained by the reaction of bismuth(III) nitrate, bipyridine (bpy) and 1,3,5-benzene-tricarboxylic acid ( $\text{H}_3\text{BTC}$ ). The  $\text{Bi}^{\text{III}}$  ion is coordinated in a distorted tricapped trigonal-prismatic geometry, defined by two N atoms of the bpy ligand, four O atoms of two  $\text{H}_3\text{BTC}^{2-}$  anions, two O atoms of a nitrate anion and one O atom of a dimethyl sulfoxide ligand. The crystal packing is stabilized by  $\text{O}-\text{H} \cdots \text{O}$  and  $\text{C}-\text{H} \cdots \text{O}$  hydrogen bonds. The S atom of the non-coordinating dimethyl sulfoxide molecule is disordered over two sets of sites with refined site-occupancies of 0.430 (19) and 0.570 (19).

### Comment

Coordination polymers are currently of great interest due to structural versatility, unique properties and their applications in different area of science. 1,3,5-benzenetricarboxylic acid ( $H_3BTC$ ) has three carboxylate groups and it can form coordination polymers with wide range of dimensionality from one-dimensional to three-dimensional.

The asymmetric unit of the title compound is presented in Fig. 1. In the title compound,  $Bi^{III}$  ion is 9-coordinated in a  $N_2O_7$  environment and its geometry is distorted tricapped trigonal prismatic. In the title compound, there is one  $H_3BTC$  in which two carboxylic groups are deprotonated. There are also one bipyridine, one nitrate and one dimethylsulfoxide molecule. Also there is one uncoordinated DMSO molecule in the packing of the compound. Bond lengths are within normal ranges. The crystal structure of title compound shows that the compound is extended by  $HBTC^{2-}$  moieties and it is a one-dimensional coordination polymer. The polymeric structure of title compound is presented in Fig. 2. There are several  $O—H\cdots O$  and  $C—H\cdots O$  hydrogen bonds in the structure of the title compound which stabilize crystal packing (Table 1).

### Experimental

A solution of  $Bi(NO_3)_3 \cdot 5H_2O$  (0.5 mmol, 0.2425 g) in DMSO (5 ml) was added to a mixture of bipyridine (1 mmol, 0.1569 g) and 1,3,5-benzenetricarboxylic acid (1 mmol, 0.2101 g) in absolute ethanol (10 ml) and stirred for 2 hrs at room temperature. After 5 months, colorless crystals of the title compound appeared (m.p: 270°C decompose).

### Refinement

All hydrogen atoms were positioned geometrically and refined as riding atoms with  $C—H = 0.93 \text{ \AA}$  and  $U_{iso}(H) = 1.2 U_{eq}(C)$  for aromatic  $C—H$  groups,  $C—H = 0.96 \text{ \AA}$  and  $U_{iso}(H) = 1.5 U_{eq}(C)$  for methyl groups and  $O—H = 0.82 \text{ \AA}$  with  $U_{iso}(H) = 1.5 U_{eq}(O)$ . The sulfur atom of uncoordinated DMSO is disordered over two positions with refined site-occupancies of 0.430 (19) and 0.570 (19).

### Figures

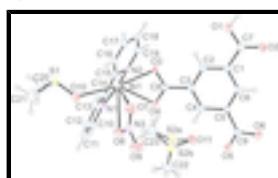

Fig. 1. The asymmetric unit of title compound with displacement ellipsoids drawn at 30% probability level.

## Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.072$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.195$	H-atom parameters constrained
$S = 1.13$	$w = 1/[\sigma^2(F_o^2) + (0.0865P)^2 + 12.3704P]$
7396 reflections	where $P = (F_o^2 + 2F_c^2)/3$
	$(\Delta/\sigma)_{\text{max}} < 0.001$

373 parameters  $\Delta\rho_{\max} = 2.25 \text{ e Å}^{-3}$   
 0 restraints  $\Delta\rho_{\min} = -2.57 \text{ e Å}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
