Received 25 January 2011; accepted 28 January 2011

Key indicators: single-crystal X-ray study; $T = 173$ K; mean $\sigma(C-C) = 0.002$ Å;
 R factor = 0.041; wR factor = 0.144; data-to-parameter ratio = 16.7.

The title compound, $C_{18}H_{16}N_6 \cdot 2CH_3OH$, was prepared by the reaction of 5,5'-bis(bromomethyl)-2,2'-bipyridine with imidazole. The main molecule lies on an inversion center located at the mid-point of the C–C bond joining the two pyridine rings. The asymmetric unit therefore contains one half-molecule and one methanol solvent molecule. The dihedral angle between the pyridine and imidazole rings is 72.32 (5)°. In the crystal, weak intermolecular O–H···N, C–H···N and C–H···O hydrogen bonds contribute to the stabilization of the packing.

5,5'-Bis[(1*H*-imidazol-1-yl)methyl]-2,2'-bipyridine methanol disolvate

S.-H. Moon, T. H. Kim and K.-M. Park

Comment

The title compound was prepared to use as a multi-dentate ligand in the formation of metallosupramolecules in line with similar previously reported compounds (Sambrook *et al.*, 2006; Zang *et al.*, 2010).

In the title compound (Scheme 1, Fig. 1), two pyridine rings are coplanar because the title compound lies on a crystallographic inversion center. The dihedral angle between the pyridine and imidazole rings is $72.32(5)^\circ$. All the bond lengths are within normal values (Allen *et al.*, 1987).

In the crystal structure, as shown in Fig. 2, weak intermolecular O—H···N, C—H···N and C—H···O hydrogen bonds are observed (Table 1). These intermolecular interactions may be contribute to the stabilization of the packing.

Experimental

A mixture of imidazole (0.120 g, 1.76 mmol) and potassium hydroxide (0.440 g, 7.84 mmol) in DMSO (10 ml) was stirred for 1 h. A DMSO solution (20 ml) of 5,5'-bis(bromomethyl)-2,2'-bipyridine (0.30 g, 0.88 mmol) was slowly added and the solution stirred for 6 h at room temperature. After water (100 ml) was added, the reaction mixture was extracted with chloroform (3×100 ml), washed with water and then dried over anhydrous MgSO_4 . The solvent was removed to give the title compound in 63% yield. X-ray quality single crystals were obtained by slow evaporation of a solution in MeOH.

Refinement

All H-atoms were positioned geometrically and refined using a riding model with $d(\text{C}—\text{H}) = 0.95 \text{ \AA}$, $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$ for aromatic, $d(\text{C}—\text{H}) = 0.84 \text{ \AA}$, $U_{\text{iso}} = 1.5U_{\text{eq}}(\text{C})$ for hydroxyl, $d(\text{C}—\text{H}) = 0.98 \text{ \AA}$, $U_{\text{iso}} = 1.5U_{\text{eq}}(\text{C})$ for methyl protons.

Figures

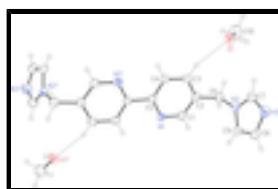

Fig. 1. The molecular structure of the title compound, showing displacement ellipsoids drawn at the 50% probability level. Hydrogen bonds are shown as dashed lines. (Symmetry code: i) $-x + 2, -y + 1, -z + 1$)

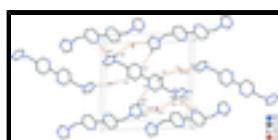

Fig. 2. Crystal packing of the title compound with intermolecular O—H···N, C—H···N and C—H···O hydrogen bonds shown as dashed lines. H atoms not involved in intermolecular interactions have been omitted for clarity (Symmetry codes: i) $-x + 1, -y + 1, -z$; ii) $x, -y + 1/2, -1/2$; iii) $-x + 1, y - 1/2, -z + 1/2$; iv) $x, -y + 1/2, z + 1/2$; v) $-x + 2, -y + 1, -z + 1$).

	$\Delta\rho_{\text{min}} = -0.24 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
