Received 17 January 2011; accepted 29 January 2011

Key indicators: single-crystal X-ray study; $T = 123\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$; disorder in main residue; R factor = 0.040; wR factor = 0.110; data-to-parameter ratio = 13.1.

In the title molecule, $C_{22}H_{19}\text{NOS}_2$, the piperidine ring adopts an envelope conformation with the benzyl substituent in an equatorial position. Each of the olefinic double bonds has an *E* configuration. The dihedral angle between the two thiophene rings is $1.55(18)^\circ$. The thiophene rings form angles of $72.21(14)$ and $73.43(14)^\circ$ with the phenyl ring. Both thiophene rings are disordered over two orientations [occupancy ratios of $0.799(1):0.201(1)$] at 180° from one another. In the crystal, weak intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds and $\text{C}-\text{H}\cdots\pi$ interactions help to stabilize the packing.

Comment

As part of our research (Rajeswari *et al.*, 2009), we have synthesized the title compound (I) and report its crystal structure here.

The molecular structure of the title compound (I) is shown in Fig. 1. The piperidine ring adopts an envelope conformation with the benzyl substituent in an equatorial position. The sum of the bond angles around N1 [328.38 (13) $^{\circ}$] indicates a pyramidal geometry. The N1 atom deviates by 0.715 (2) Å from the least-squares plane passing through atoms C1—C5. Each of the olefinic double bonds has an E configuration. The dihedral angle between the two thiophene rings is 1.55 (18) $^{\circ}$. The thiophene rings form angles of 72.21 (14) and 73.43 (14) $^{\circ}$ with the phenyl ring. Both thiophene rings are disordered over two orientations [occupancies of 0.799 (1)/0.201 (1)] at 180 $^{\circ}$ from one another. In the crystal, weak intermolecular C13A—H13A···O1 hydrogen bonds and C16—H16A··· π interactions involving the phenyl ring (C17—C22) help to stabilize the packing (Table 1, Fig. 2).

Experimental

The mixture of 1-benzylpiperidin-4-one (1.9 ml, 0.01 mol) and thiophene-3-aldehyde (1.8 ml, 0.02 mol) in ethanol (95%, 10 ml), was added with 5 ml of 20% sodium hydroxide followed by the heating on a waterbath for 30 minutes. The solid separated was filtered and recrystallized by slow evaporation from 95% ethanol. The yield was (3.0 g, 80%).

Refinement

H6 at C6 and H11 at C11 atoms were located in a difference Fourier map and refined freely: C6—H6 = 0.943 (19) Å, C11—H11 = 0.92 (2) Å. Remaining H atoms were positioned geometrically and allowed to ride on their parent atoms, with C—H = 0.95 - 0.99 Å and $U_{\text{iso}}(\text{H})$ = 1.2 times $U_{\text{eq}}(\text{C})$. Both thiophene rings were found disordered with occupancies 0.799 (1)/0.201 (1). The disordered thiophene moieties were restricted to have C—S distances of 1.718 (2) to 1.718 (15) Å. A damping factor (damp 100 15 in the final refinement cycles) was applied to avoid large displacements of the hydrogen atoms of the less occupied thiophene rings.

Figures

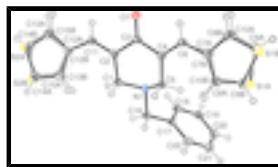

Fig. 1. The molecular structure of the title compound, showing the atom-numbering scheme and displacement ellipsoids drawn at the 30% probability level. H atoms are shown as small spheres of arbitrary radius. Both thiophene rings are disordered over two orientations (0.799 (1)/0.201 (1)).

supplementary materials

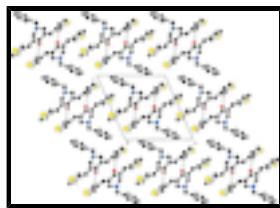

Fig. 2. The packing of the title compound, viewed down the a axis. Dashed lines indicate weak hydrogen bonds. H atoms not involved in hydrogen bonding have been omitted.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.040$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.110$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0635P)^2 + 0.4312P]$
3615 reflections	where $P = (F_o^2 + 2F_c^2)/3$
	$(\Delta/\sigma)_{\text{max}} = 0.001$

276 parameters $\Delta\rho_{\max} = 0.37 \text{ e Å}^{-3}$
 72 restraints $\Delta\rho_{\min} = -0.27 \text{ e Å}^{-3}$

Special details

Geometry. Bond distances, angles *etc.* have been calculated using the rounded fractional coordinates. All su's are estimated from the variances of the (full) variance-covariance matrix. The cell e.s.d.'s are taken into account in the estimation of distances, angles and torsion angles

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

Symmetry codes: (i) $-x, -y+2, -z+1$; (ii) $-x+1, -y+1, -z+1$; (iii) $-x+1, -y+2, -z+1$; (iv) $-x+1, -y, -z$; (v) $x-1, y, z$; (vi) $-x+1, -y+1, -z$; (vii) $-x+2, -y+1, -z+1$; (viii) $x+1, y, z$; (ix) $-x, -y+1, -z$.

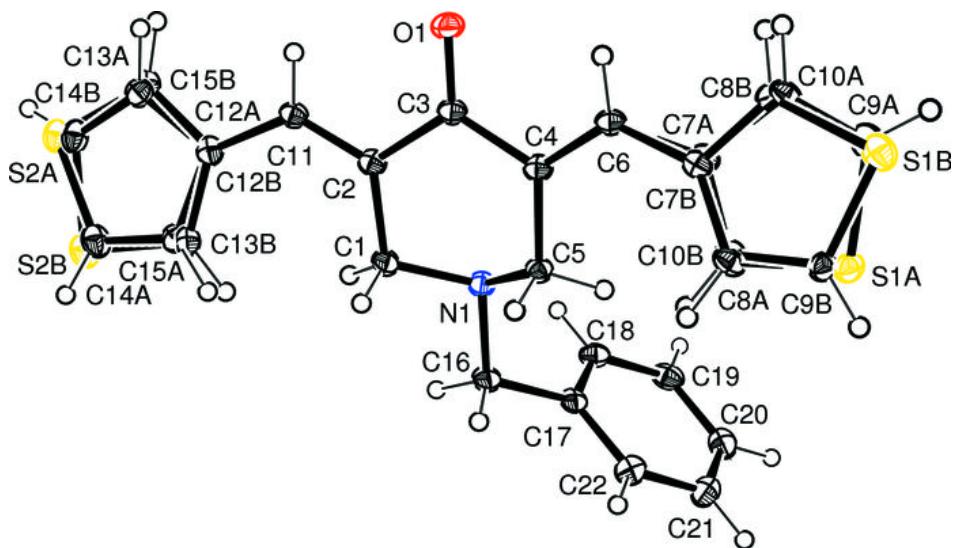

Hydrogen-bond geometry (\AA , °)

Cg6 is the centroid of the C17—C22 ring.

$D-\text{H}\cdots A$	$D-\text{H}$	$\text{H}\cdots A$	$D\cdots A$	$D-\text{H}\cdots A$
C13A—H13A···O1 ^{vii}	0.95	2.39	3.177 (4)	140
C16—H16A···Cg6 ^{ix}	0.99	2.68	3.6017 (19)	156

Symmetry codes: (vii) $-x+2, -y+1, -z+1$; (ix) $-x, -y+1, -z$.
