Received 9 February 2011; accepted 12 February 2011

Key indicators: single-crystal X-ray study;  $T = 298\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  $R$  factor = 0.028;  $wR$  factor = 0.080; data-to-parameter ratio = 12.2.

The title compound,  $C_{16}H_{23}Cl_2NO$ , was synthesised from  $\beta$ -himachalene (3,5,5,9-tetramethyl-2,4a,5,6,7,8-hexahydro-1*H*-benzocycloheptene), which was isolated from the essential oil of the Atlas cedar (*Cedrus Atlantica*). The molecule contains a seven-membered ring, which is fused to a five- and a three-membered ring. The five-membered ring has a twisted conformation, whereas the seven-membered ring displays a chair conformation. The dihedral angle between the five- and seven-membered rings is  $45.26(9)^\circ$ . The absolute structure was established unambiguously from anomalous dispersion effects. In the crystal, molecules are linked into chains propagating along the  $b$  axis by intermolecular  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds; an intramolecular  $\text{N}-\text{H}\cdots\text{O}$  link also occurs.

#### **Comment**

The essential oil of the Alas cedar (*Cedrus atlantica*) consist mainly (50%) of a bicyclic hydrocarbon called  $\beta$ -himachalene (Joseph & Dev (1968); Plattier & Teisseire(1974)). The reactivity of this sesquiterpene and its derivatives has been studied extensively by our team in order to prepare new products having biological proprieties (Lassaba *et al.*, 1998; Chekroun *et al.*, 2000; El Jamili *et al.*, 2002; Dakir *et al.*, 2004). Indeed, these compounds were tested, using the food poisoning technique, for their potential antifungal activity against phytopathogen *Botrytis cinerea* (Daoubi *et al.*, 2004). Thus the action of one equivalent of dichlorocarbene, generated *in situ* from chloroform in the presence of sodium hydroxide as base and n-benzyltriethylammonium chloride as catalyst, on  $\beta$ -himachalene produces only (1S,3R,8R)-2,2-dichloro-3,7,7,10-tetramethyltricyclo[6.4.0.0<sup>1,3</sup>] dodec-9-ene (El Jamili *et al.*, 2002). Treatment of the latter by two equivalents of *N*-bromosuccinimide (NBS) give (1S, 3R, 8R, 11R)-2,2-dichloro-3,7,7,10-tetraethyltricyclo[6.4.0.0<sup>1,3</sup>] dodec-9-en-11-one(Dakir *et al.*, 2004). This enone was treated with the sodium azide in trifluoroacetic acid medium, give with a yield (60%) (1S, 3R, 8R) -9-(1-aminoethylidene)-2,2-dichloro-3,7,7- trimethyltricyclo[6.3.0.0<sup>1,3</sup>]undecan -10-one. The structure of this new product was determined by NMR spectral analysis of 1H, 13C and mass spectroscopy and confirmed by its single-crystal X-ray structure. The molecule is built up from two fused five-membered and seven-membered rings (Fig. 1). The five-membered ring adopts a twisted conformation,as indicated by Cremer & Pople (1975) puckering parameters Q = 0.2822 (2) Å and  $\phi$  = 199.2 (4) $^{\circ}$ . The seven-membered ring displays a chair conformation with QT = 0.7470 (2) Å,  $\theta_2$  = 27.72 (2) $^{\circ}$ ,  $\varphi_2$  = -51.85 (14) $^{\circ}$  and  $\varphi_3$  =-78.15 (2) $^{\circ}$ . In the crystal structure, molecules are linked into chains (Fig. 2) running along the *b* axis by intermolecular N—H $\cdots$ O hydrogen bonds (Table 1) involving the O1 and N atoms. Owing to the presence of Cl atoms, the absolute configuration could be fully confirmed, by refining the Flack parameter (Flack & Bernardinelli (2000)) as C1(S), C3(R)and C8(R).

#### **Experimental**

To a solution of enone 1 g (3.32 mmol) in 20 ml of trifluoroacetic acid at 10 °C was added with stirring 1 g (15.38 mmol) of NaN3. After being stirred at room temperature for 24 h, the reaction mixture was neutralized with a solution of Na2CO3 (10%) and extracted three time with diethylether (3x20ml). The combined organic phases were dried on Na2SO4, filtered and concentrated at reduced pressure to give the crude product which was chromatographed on a silica gel column with hexane- ether as eluent (20/80) to give 630 mg(1.99 mmol) of (1S, 3R, 8R)-9-(1-aminoethylidene)-2,2-dichloro-3,7,7-trimethyltricyclo [6.3.0.0<sup>1,3</sup>]undecan -10-one.The title compound was recrystallized in diethylether.

#### **Refinement**

except H1 and H2,all H atoms were fixed geometrically and treated as riding with C—H = 0.96 Å (methyl), 0.97 Å (methylen), 0.98Å (methine) with  $U_{\text{iso}}(\text{H})$  = 1.2 $U_{\text{eq}}$  (methylene, methine) or  $U_{\text{iso}}(\text{H})$  = 1.5 $U_{\text{eq}}$  (methyl).

### Special details

**Geometry.** All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.
