Received 17 February 2011; accepted 10 March 2011

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$ ; disorder in solvent or counterion;  $R$  factor = 0.045;  $wR$  factor = 0.143; data-to-parameter ratio = 14.0.

In the title complex,  $[\text{CoCl}_2(\text{C}_{10}\text{H}_8\text{N}_2)_2] \cdot 3\text{H}_2\text{O}$ , the Co(II) ion is situated on a twofold rotation axis and exhibits a slightly distorted octahedral geometry and is chelated by four N atoms of the two bidentate 2,2'-bipyridine ligands and two  $\text{Cl}^-$  ions. The crystal packing is stabilized by hydrogen bonding formed between chloride ions and adjacent water molecules. One of the two independent water molecules in the asymmetric unit is disordered over two sets of sites, each on a twofold rotation axis, in a 0.734 (17):0.269 (17) ratio.

### **cis-Bis(2,2'-bipyridine- $\kappa^2N,N'$ )dichloridocobalt(II) trihydrate**

**K. Arun Kumar, M. Amuthaselvi and A. Dayalan**

#### **Comment**

2,2-Bipyridine and 1,10-phenanthroline have been extensively used to form different complexes with transition metal ions in their various oxidation states. Tris(2,2'-bipyridine)cobalt(III) complexed with bovine serum albumin has been reported as biosensors (Ying *et al.*, 2006). Bipyridine cobalt complexes were found to have considerable antibacterial activities (Senthilkumar & Arunachalam, 2008). The use of tris(bipyridine)cobalt(II) for immunoassay of carcinoma antigen-125 has been reported recently (Shihong *et al.*, 2009).

The cobalt(II) ion has site symmetry 2 and assumes octahedral geometry with two symmetry related 2,2'-bipyridine ligands and two chloride ions. Cobalt(II) is linked to two 2,2'-bipyridine bidentate ligands *via* four nitrogen atoms and two chloride ions. The two 2,2'-bipyridine ligands are in *cis* position with mutually perpendicular to each other. The hydrated water molecules in the crystal packing helps the stabilization of crystal packing by forming hydrogen bonding between adjacent chloride ions.

#### **Experimental**

The complex was prepared by adding a solution of 2,2'-bipyridine (0.01 mole) in 60 ml of acetone, to a solution of cobalt(II) chloride (0.005 mole) in 60 ml of acetone. The resulting solution was stirred for two hours, filtered and dried over vacuum desiccator to get red colour complex (yield 90%). The dark red colored crystals, suitable for x-ray analysis, were obtained by slow evaporation from alcoholic solution.

#### **Refinement**

There is 1.5 water molecules per asymmetric unit. The H atoms of water oxygen O1 could be located in difference Fourier map. These H atoms were restrained to be at a distance of 0.85 Å from O1. The inter hydrogen distance was restrained to be 1.388 Å so as to retain the tetrahedral H—O—H angle. The other half molecule was disordered in two positions (O2 and O3). Their occupancies were refined initially as free variables and later the sum of the occupancies restrained as 0.5. The H atoms of disordered water molecules could not be located. The aromatic H atoms were constrained as riding atoms with d(C—H) = 0.93 Å and  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{equ}}(\text{C})$ .

#### **Figures**

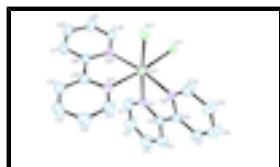

Fig. 1. ORTEP of  $[\text{Co}(\text{bpy})_2(\text{Cl})_2] \cdot 3\text{H}_2\text{O}$  drawn with 50% displacement ellipsoid level. Water molecules have been omitted for clarity.

### *Crystal data*

$[\text{CoCl}_2(\text{C}_{10}\text{H}_8\text{N}_2)_2] \cdot 3\text{H}_2\text{O}$	$F(000) = 1020$
$M_r = 496.25$	$D_x = 1.444 \text{ Mg m}^{-3}$
Monoclinic, $C2/c$	$\text{Mo } K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
Hall symbol: -C2yc	Cell parameters from 6958 reflections
$a = 18.3644 (8) \text{ \AA}$	$\theta = 2.4\text{--}25.4^\circ$
$b = 13.1902 (8) \text{ \AA}$	$\mu = 1.01 \text{ mm}^{-1}$
$c = 10.8854 (6) \text{ \AA}$	$T = 293 \text{ K}$
$\beta = 120.030 (4)^\circ$	Block, red
$V = 2282.8 (2) \text{ \AA}^3$	$0.30 \times 0.20 \times 0.20 \text{ mm}$
$Z = 4$	

### *Data collection*

Bruker Kappa APEXII CCD diffractometer	2123 independent reflections
Radiation source: fine-focus sealed tube graphite	1731 reflections with $I > 2\sigma(I)$
$\omega$ and $\varphi$ scans	$R_{\text{int}} = 0.051$
Absorption correction: multi-scan ( <i>SADABS</i> ; Bruker, 2004)	$\theta_{\text{max}} = 25.6^\circ$ , $\theta_{\text{min}} = 2.0^\circ$
$T_{\text{min}} = 0.721$ , $T_{\text{max}} = 0.823$	$h = -22 \rightarrow 19$
18022 measured reflections	$k = -15 \rightarrow 15$
	$l = -13 \rightarrow 13$

### *Refinement*

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.045$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.143$	$w = 1/[\sigma^2(F_o^2) + (0.0754P)^2 + 3.251P]$
$S = 1.19$	where $P = (F_o^2 + 2F_c^2)/3$
2123 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
152 parameters	$\Delta\rho_{\text{max}} = 0.67 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.65 \text{ e \AA}^{-3}$

Extinction correction: *SHELXL97* (Sheldrick, 1997),  
 $F_c^* = k F_c [1 + 0.001 x F_c^2 \lambda^3 / \sin(2\theta)]^{-1/4}$

Primary atom site location: structure-invariant direct methods Extinction coefficient: 0.0015 (5)

### *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
