Received 13 February 2011; accepted 8 March 2011

Key indicators: single-crystal X-ray study; $T = 293$ K; mean $\sigma(C-C) = 0.005$ Å; R factor = 0.040; wR factor = 0.102; data-to-parameter ratio = 15.1.

In the title compound, $[Ag_2(C_{14}H_{14}N_4)_2](C_{14}H_8N_2O_4)\cdot 2H_2O$, each of the two unique Ag^+ ions is two-coordinated by two N atoms from two different 1,4-bis[(imidazol-1-yl)methyl]benzene ligands in an almost linear fashion [$N-Ag-N = 170.34(10)$ and $160.25(10)^\circ$]. The 4,4'-diazenediyldibenzoate anions do not coordinate to Ag. O—H···O hydrogen bonds stabilize the crystal structure.

Comment

Coordination polymers are of considerable interest because of their potential application in the areas of catalysis, separation, sorption, sensors, and in electronic and magnetic devices (Chen *et al.*, 2008). So far, the rigid rod-like spacer is well known in the construction of coordination polymers. However, the coordination polymers with the flexible N-donor ligands such as 1,4-bis(imidazole-1-ylmethyl)benzene (1,4-bix) and dicarboxylic acids such as 4,4'-diazenediyldibenzoic acid (H_2L) have not been well explored (Xu *et al.*, 2005). Here, 1,4-bix assembles with silver and H_2L to yield a coordination polymer $[Ag_2(1,4\text{-bix})] \cdot L \cdot 2H_2O$, (I).

As shown in Fig. 1, there are two Ag(I) atoms, one 1,4-bix ligand, one L anion, and two free water molecules in the asymmetric unit. Each Ag atom (Ag1 or Ag2) is two-coordinated by two nitrogen atoms from two different 1,4-bix ligands in a linear sphere. The Ag atoms are bridged by the 1,4-bix ligands to generate a chain structure. Notably, the L anion did not coordinate to the Ag center, but acted as a counter-anion. The O-H \cdots O hydrogen bonds further stabilize the chain structure (Table 1).

Experimental

A mixture of $AgNO_3 \cdot 2H_2O$ (0.5 mmol), H_2L (0.5 mmol), 1,4-bix (0.5 mmol), and H_2O (12 ml) was adjusted to pH = 5–6 by addition of aqueous NaOH solution, and heated at 140 °C for 3 days. After the mixture was slowly cooled to room temperature, crystals of (I) were yielded (27% yield).

Refinement

All H atoms on C atoms were positioned geometrically (C—H = 0.93 Å) and refined as riding, with $U_{iso}(H)=1.2U_{eq}(C)$. H atoms bonded to water molecules were located in difference Fourier maps and refined isotropically with distance restraints of O—H = 0.85±0.01 and H \cdots H = 1.35 ± 0.01 Å with $U_{iso} = 1.5U_{eq}(O)$.

Figures

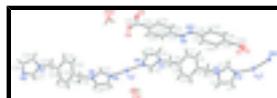

Fig. 1. The structure of the title compound, showing the atomic numbering scheme. Displacement ellipsoids are drawn at the 30% probability level. Symmetry code: (i) x-2, 1+y, 1+z.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.040$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.102$	H-atom parameters constrained
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.0528P)^2]$
8145 reflections	where $P = (F_o^2 + 2F_c^2)/3$
541 parameters	$(\Delta/\sigma)_{\text{max}} = 0.001$
6 restraints	$\Delta\rho_{\text{max}} = 1.38 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -1.04 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
