Received 13 March 2011; accepted 18 March 2011

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$ ;  $R$  factor = 0.053;  $wR$  factor = 0.131; data-to-parameter ratio = 14.3.

In the title compound,  $\text{C}_{21}\text{H}_{28}\text{Cl}_2\text{N}_3\text{O}_6$ , the nitronyl nitroxide ring displays a half-chair conformation, whereas the pyrrolidine ring has an envelope conformation. These two rings are twisted to each other with  $\text{N}-\text{C}-\text{C}-\text{N}$  torsion angles around the connecting  $\text{C}-\text{C}$  bond of  $48.9(6)$  and  $-127.0(5)\text{ }^\circ$ . The benzene ring is nearly perpendicular to the pyrrolidine ring, with torsion angles around the connecting  $\text{C}-\text{C}$  bond of  $86.3(6)$  and  $-97.7(6)\text{ }^\circ$ . The crystal structure is stabilized by  $\text{C}-\text{H}\cdots\text{O}$  and  $\text{C}-\text{H}\cdots\pi$  hydrogen bonds, which build up a three-dimensional network.

**Comment**

Nitronyl nitroxides, stable organic radicals, synthesized more than 30 years ago (Osiecki *et al.*, 1968), have received considerable attention recently because of their capability of magnetism, anticancer, antiradiation and antioxidation in biological chemistry and magnetic material fields (Shemsi *et al.*, 2007; Wu *et al.*, 2006). Chiral nitroxides are well chosen as potential precursors of chiral molecule-based magnets. However, chiral nitronyl nitroxide radicals with the chiral centers sitting very close to the oxyl group are relatively few in the literature (Minguet *et al.*, 2001; Shimono *et al.*, 2004; Tian *et al.*, 2011).

In the title compound, the nitronyl nitroxide ring displays half-chair conformation with puckering parameters,  $Q2 = 0.096(5)\text{\AA}$  and  $\phi = 272(3)^\circ$  (Cremer & Pople, 1975) whereas the pyrrolidine ring has an envelope conformation with puckering parameters  $Q(2) = 0.393(6)\text{\AA}$  and  $\phi = 104.3(7)^\circ$ . The N3—C12—C13—C14, -97.7(6) $^\circ$ , and N3—C12—C13—C18, 86.3(6) $^\circ$ , torsion angles the involving the ketone bridging group show that the phenyl and the pyrrolidine rings are nearly perpendicular (Fig. 1). The bond distances and bond angles within the molecule agree with values reported in the Cambridge Structural Database (Allen, 2002).

Intermolecular C—H $\cdots$ O and C—H $\cdots$  $\pi$  hydrogen bonds stabilize the packing building up a three dimensionnal network (Table 1).

**Experimental**

2,6-dichloro-3,4,5-trimethoxybenzoylchloride (2.98 g, 10.0 mmol), Et<sub>3</sub>N (3.1 ml) were added to in dry CH<sub>2</sub>Cl<sub>2</sub> with vigorous stirring in an ice bath. To this mixture, a solution of prolinol (1.0 g, 10 mmol) in dry CH<sub>2</sub>Cl<sub>2</sub> was added dropwise over a period of 20 min. The mixture was warmed to room temperature and stirred for 2 h. Then the reaction mixture was treated with water and extracted with CH<sub>2</sub>Cl<sub>2</sub>. The organic layer was dried over anhydrous MgSO<sub>4</sub> and concentrated. The crude product was purified by column chromatography on silica gel using ethyl acetate/petroleum ether (3:1) as eluant, giving a colorless oil product (3.1 g, 83.8%). To a reaction mixture of this product (3.61 g, 10 mmol), TEMPO (0.025 g, 0.16 mmol) and trichloroisocyanuric acid (TCCA, 3.7 g, 16 mmol), CH<sub>2</sub>Cl<sub>2</sub> was added. Then the mixture was stirred for 20 min and filtered on Celite. The precipitate was purified by column chromatography on silica gel using ethyl acetate/petroleumether/triethylamine (2:1:0.1) as eluant, giving the product 1-(2,6-dichloro-3,4,5-trimethoxybenzoyl)pyrrolidine-2-carbaldehyde (3.10 g, 85.0%). 2,3-Dimethyl-2,3-bis(hydroxylamino) butane (0.74 g, 10.0 mmol) and 1-(2,6-dichloro-3,4,5-trimethoxybenzoyl) pyrrolidine-2-carbaldehyde (1.81 g, 5.0 mmol) were dissolved in methanol. The reaction was stirred for 10 h at reflux temperature, then cooled to room temperature and filtered. The cake was suspended in CH<sub>2</sub>Cl<sub>2</sub> (150.0 ml) and cooled at ice bath for 10 min. Then the reaction mixture was added to an aqueous solution of NaIO<sub>4</sub> stirring for 15 min. The aqueous phase was extracted with CH<sub>2</sub>Cl<sub>2</sub> and the organic layer was combined and dried over MgSO<sub>4</sub>. Then the solvent was removed

to give a amaranthine residue which was purified by a flash columnchromatography with the elution of n-hexane/ethyl acetate (1:1) to yield thetitle compound (I) as a dark amaranthine powder. Single crystals of compound (I) were obtained from the 1/1 mixed solution of *n*-heptane and dichloromethane.

### Refinement

All H atoms attached to C atoms were fixed geometrically and treated as riding with C—H = 0.96 Å (methyl), 0.97 Å (methylene) and 0.93 Å (aromatic) with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$  or  $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{Cmethyl})$ .

### Figures

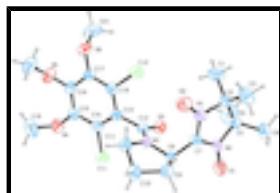

Fig. 1. Molecular structure of the title compound (I), showing the atom labeling scheme. Displacement ellipsoids are drawn at the 30% probability level. H atoms are represented as small spheres of arbitrary radii.

4252 reflections	$\Delta\rho_{\min} = -0.16 \text{ e \AA}^{-3}$
297 parameters	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001x F_c^2 \lambda^3 / \sin(2\theta)]^{1/4}$
0 restraints	Extinction coefficient: 0.0025 (7)
Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 1834 Friedel pairs
Secondary atom site location: difference Fourier map	Flack parameter: 0.01 (10)

## *Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
