Received 19 March 2011; accepted 25 March 2011

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.005\text{ \AA}$; R factor = 0.049; wR factor = 0.138; data-to-parameter ratio = 22.2.

In the title compound, $\text{C}_{19}\text{H}_{11}\text{N}_3\text{O}_2\text{SClBr}$, the chromene ring system and the thiazole ring are each approximately planar, with maximum deviations of $0.033(3)\text{ \AA}$ and $0.006(3)\text{ \AA}$, respectively. The molecule adopts an *E* configuration about the central $\text{C}=\text{N}$ double bond. The central thiazole ring makes dihedral angles of $9.06(14)^\circ$ and $12.07(11)^\circ$ with the chloro-substituted phenyl ring and the chromene ring, respectively. The molecular structure features a short $\text{C}-\text{H}\cdots\text{O}$ contact, which generates an *S*(6) ring motif. The crystal structure is stabilized by intermolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds, which link the molecules into chains along the *b* axis. $\pi-\pi$ stacking interactions [centroid-centroid distance = $3.4813(15)\text{ \AA}$] are also present.

Comment

Thiazolyl coumarin derivatives are reported to be associated with diverse applications. They have industrial applications as fluorescent probes, laser dyes (Samsonova *et al.*, 2007) and luminescents (Bullock *et al.*, 2009). They also exhibit a variety of biological activities as anticonvulsants (Siddiqui *et al.*, 2009), analgesics, anti-inflammatory (Kalkhambkar *et al.*, 2007) and antimicrobial agents (Kamal *et al.*, 2009; Desai *et al.*, 2008). The title compound is a new derivative of thiazolylcoumarin. We present here its crystal structure.

The molecular structure of the compound, (I), displays a trans configuration with respect to the C13=N3 double bond. The chromene (O1/C1–C9) ring system and thiazole (S1/N1/C10–C12) ring are approximately planar, with the maximum deviation of 0.033 (3) Å for atom C2 and 0.006 (3) Å for atom C12, respectively. The central thiazole (S1/N1/C10–C12) ring makes dihedral angles of 9.06 (14)° and 12.07 (11)° with the chloro-substituted phenyl (C14–C19) ring and the chromene (O1/C1–C9) ring, respectively.

In the crystal packing (Fig. 2), the molecular structure is stabilized by an intramolecular C—H···O (Table 1) hydrogen bond which generates an *S*(6) (Bernstein *et al.*, 1995) ring motif. Furthermore, the crystal structure is stabilized by intermolecular N—H···O hydrogen bonds which link the molecules into chains parallel to the *b*-axis. $\pi\cdots\pi$ [centroid-centroid distance = 3.4813 (15) Å; 1/2-*X*, 1/2-*Y*, 2-*Z*] stacking interactions between the thiazole (S1/N1/C10–C12) and pyran (O1/C3–C7) rings are also observed.

Experimental

4-chlorobenzylidene thiosemicarbazone (Bakkar *et al.*, 2003) and 6-bromo-3-(2-bromoacetyl)-2*H*-chromen-2-one (Vijesh *et al.*, 2010) were synthesized as reported in the literature. The title compound (I) was obtained by the cyclocondensation of 4-chlorobenzylidene thiosemicarbazone with 6-bromo-3-(2-bromoacetyl)-2*H*-chromen-2-one. A solution of 6-bromo-3-(2-bromoacetyl)-2*H*-chromen-2-one (2.5 mmol) and 4-chlorobenzylidene thiosemicarbazone (2.5 mmol) in chloroform-ethanol (2:1) was refluxed for 2 hours at 60°C to yield a dense yellow precipitate. The reaction mixture was cooled in ice bath and basified with ammonia to pH 7–8. The title compound (I) was recrystallized from ethanol-chloroform (1:2) to give yellow block like crystals.

Refinement

Atom H1N2 was located from a difference Fourier map and refined freely [N—H = 0.81 (4) Å]. The remaining H atoms were positioned geometrically [C—H = 0.93 Å] and were refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$. The highest residual electron density peak is located at 1.20 Å from Br1 and the deepest hole 0.91 located at from Br1.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.049$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.138$	H atoms treated by a mixture of independent and constrained refinement
$S = 0.97$	$w = 1/[\sigma^2(F_o^2) + (0.0551P)^2 + 0.960P]$ where $P = (F_o^2 + 2F_c^2)/3$
5499 reflections	$(\Delta/\sigma)_{\max} = 0.001$
248 parameters	$\Delta\rho_{\max} = 0.31 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.34 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
