Received 23 March 2011; accepted 3 April 2011

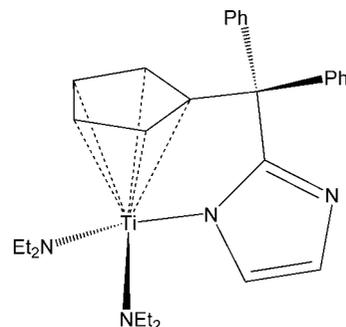

Key indicators: single-crystal X-ray study; $T = 296$ K; mean $\sigma(\text{C}-\text{C}) = 0.005$ Å; R factor = 0.040; wR factor = 0.102; data-to-parameter ratio = 15.8.

The chemically achiral title molecule, $[\text{Ti}(\text{C}_4\text{H}_9\text{N})_2(\text{C}_{21}\text{H}_{16}\text{N}_2)]$, crystallizes in the chiral space group $P2_1$. All three N atoms coordinating to the Ti^{IV} atom adopt planar environments [sums of valence angles = 359.5 (6), 360.0 (7) and 360.0 (6)°], which is indicative of $p\pi-d\pi$ donation from all of these N atoms to the metal and, thus, of the formal 18 e^- nature of the complex. The overall coordination about the Ti^{IV} atom is distorted tetrahedral, assuming the cyclopentadienyl ring occupies one coordination site. The $\text{Ti}-\text{N}_{\text{imidazole}}$ amide-type bond is longer by approximately 0.16 Å than the other two $\text{Ti}-\text{N}_{\text{amide}}$ bonds.

{2-[(η^5 -Cyclopentadienyl)diphenylmethyl]-1*H*-imidazolido- κ N}-bis(*N,N*-diethylamido)titanium(IV)

X. Cai, Y. Xu, W. Nie and M. V. Borzov

Comment

Cyclopentadienes (Cp-s) with pendant 1*H*-imidazol(in)-2-yl side-chain functional groups, their mono- and di-Li salts, and group 4 transition metal complexes of general type [η^5 -Cp-(C₁ or C₂)-imidazol(in)e)- κ N]-M^{IV}L_n [M = Ti, Zr; L_n = Cl₃, (NR₂)₂] have been described previously (Krut'ko *et al.*, 2006; Nie *et al.*, 2008; Sun *et al.*, 2009; Wang *et al.*, 2009; Ge *et al.*, 2010; Sun *et al.*, 2010). The present contribution reports the structural investigation of the closest analogue of two Ti^{IV} 18e⁻ (η^5 -Cp)tris(*sec*-amido)- type complexes described recently by Wang *et al.* (2009).

The title complex, [Ti(C₄H₁₀N)₂(C₂₁H₁₆N₂)], (I), was prepared by treatment of 2-[(cyclopentadienyl)diphenylmethyl]-1*H*-imidazole, C₂₁H₁₈N₂, (II), with Ti(NEt₂)₄ in toluene by an analogy to what described in Wang *et al.* (2009) (see Experimental for more details). Of interest, despite its molecule is chemically achiral, (I) crystallizes in the chiral space group *P*2₁. The Ti^{IV} is in a distorted tetrahedral environment (assuming the Cp-ring occupies one coordination site), with all three N-atoms coordinating to the Ti-centre adopting planar environments [valent angles sums 359.5 (6), 360.0 (7), and 360.0 (6)°, respectively] what is indicative of the *p* π -*d* π donation from all of these N-atoms to the metal and, thus, of the formal 18e⁻ nature of the complex. The Ti—N_{imidazole} amido-type bond is approximately by 0.16 Å longer than the other two Ti—N amido-bonds, presumably due to the rigid bridge constraint and/or certain electronic effects (e.g. involvement of the N_{imidazole} *p*-AO into the aromatic system of the heterocycle ring).

The bond lengths and angles at the Ti atom are close to those reported by Wang *et al.* (2009). The distance of the r.m.s. plane (PL1) of the Cp ring (C11–C15) to the Ti atom is 2.057 Å. The Ti atom only slightly deviates from the r.m.s. plane (PL2) of the imidazole C1/N1/C2/C3/N2 ring by 0.201 (5) Å, with the PL1–PL2 angle being 101.58 (14)°.

Analysis of the Cambridge Structural Database (version 5.27, release: May 2009) (Allen, 2002) reveals 16 structurally characterized Ti complexes of similar η^5 -CpTi-tris(*sec*-amido) types (22 independent fragments) (Rhodes *et al.*, 2002; Li *et al.*, 2003; Seo *et al.*, 2001; Kunz *et al.*, 2002; Carpenetti *et al.*, 1996; Kunz *et al.*, 2001; Bertolasi *et al.*, 2007; Wu *et al.*, 2006; Cano *et al.*, 2005; Martin *et al.*, 1994). Noteworthy, that except of η^5 -Cp*-Ti(NMe₂)₃ (Martin *et al.*, 1994) all these complexes as in case of compound (I) contain, at least, one amido-functionality linked to the Cp-ring with a flexible bridge.

Experimental

All operations were performed under Ar atmosphere in conventional glassware or in all-sealed evacuated glass vessels with application of a high-vacuum line (the residual pressure of non-condensable gases within 1.5–1.0×10⁻³ Torr; 1 Torr = 133 Pa). 5-(Diphenylmethylidene)cyclopenta-1,3-diene (6,6-diphenylfulvene) was prepared as described by Chajara & Ottosson (2004). Ti(NEt₂)₄ was prepared as described earlier by Bürger & Dämmen (1974); Bradley & Thomas (1960).

supplementary materials

1-Diethoxymethyl-1*H*-imidazole and its 2-lithiated derivative were prepared as described by Curtis & Brown (1980). All other chemicals were commercially available and purified by conventional methods (Armarego & Perrin, 1997). Solvents were purified by distillation over sodium benzophenoneketyl (diethyl ether, THF), Na—K alloy (toluene, hexane, benzene), and CaH₂ (chloroform). The deuterated solvent (C₆D₆) was dried similarly. Compound (I) was prepared in a full analogy to what was described by Wang *et al.* (2009). The NMR spectra were recorded on a Varian INOVA-400 instrument. For ¹H spectrum, the TMS (δ_H = 0.00 and δ_C = 0.0) resonance was used as an internal reference standard. ¹H NMR (298 K, C₆D₆): δ = 0.70 (virt. t, an X-part of an ABX₃ spin system, 12 H, ³J_{AX} = ³J_{BX} = 6.7 Hz, NCH₂CH₃), 3.12, 3.46 (both virt. dq, an AB-part of an ABX₃ spin system, 4 H + 4H, ³J_{AX} = ³J_{BX} = 6.7 Hz, ²J_{AB} = 14.0 Hz, NCH₂CH₃), 5.74 (unresolved m, 4 H, CH in Cp), 7.04, 7.15, 7.86 (all m, *p*-, *m*-, and *o*-CH in Ph, in respective order), 7.21, 7.55 (an AB spin system, 1 H + 1 H, ²J_{AB} = 1.2 Hz, imidazole ring protons).

A crystal of (I) suitable for X-ray diffraction analysis was picked up from the isolated material and mounted inside a Lindemann glass capillary (diameter 0.5 mm; N₂-filled glove-box).

Refinement

H atoms were treated as riding atoms with distances C—H = 0.96 (CH₃), 0.97 (CH₂), 0.93 Å (C_{Ar}H), and $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{C})$, 1.2 $U_{\text{eq}}(\text{C})$, and 1.2 $U_{\text{eq}}(\text{C})$, respectively.

Figures

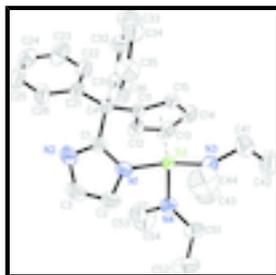

Fig. 1. The molecule of compound (I) in the asymmetric unit with the labelling scheme. Displacement ellipsoids are shown at the 50% probability level. All H atoms have been omitted for clarity.

Primary atom site location: structure-invariant direct methods	Absolute structure: Flack (1983), 2209 Friedel pairs
	Flack parameter: 0.02 (3)

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F , and R- factors based on ALL data will be even larger.
