Received 16 March 2011; accepted 29 March 2011

Key indicators: single-crystal X-ray study; $T = 297$ K; mean $\sigma(I) = 0.000$ Å; disorder in main residue; R factor = 0.044; wR factor = 0.106; data-to-parameter ratio = 10.3.

The whole molecule of the title compound, $C_{23}H_{14}O_6S$, is disordered over two sets of sites with refined occupancies of 0.8733 (12):0.1267 (12). The dihedral angle between the mean planes through the chromene ring systems is 56.31 (5) and 55.2 (3)° for the major and minor components, respectively. In both components, a pair of intramolecular O—H...O interactions generate rings of $S(8)$ graph-set motif. In the crystal, the molecules are linked by intermolecular C—H...O interactions, forming chains along the b axis. The structure is further stabilized by π – π interactions with centroid–centroid distances of 3.594 (2) and 3.608 (5) Å.

4-Hydroxy-3-[(4-hydroxy-2-oxo-2H-3-chromenyl)(3-thienyl)methyl]-2H-chromen-2-one

M. Asad, C.-W. Oo, H. Osman, M. M. Rosli and H.-K. Fun

Comment

The colourless crystalline bis 4-hydroxycoumarins are obtained from the condensation of coumarin and aldehyde derivatives (Sullivan *et al.*, 1943). A large number of structurally novel 4-hydroxycoumarin derivatives have exhibited estrogenic activity on MCF-7 breast carcinoma cells (Jacquot *et al.*, 2001) and possess several types of biological activities such as antifungal (Kokil *et al.*, 2010), anticoagulant (Abdelhafez *et al.*, 2010) anticancer (Huang *et al.*, 2010), anti-HIV (Skulnick *et al.*, 1997), antibacterial and anti-inflammatory (Siddiqui & Asad, 2010) activities.

In the title compound (Fig. 1), the whole molecule is disordered over two orientations with refined site occupancies of 0.873 (1):0.127 (1). The chromene ring systems are almost planar, with maximum deviation of 0.099 (3) Å for atom C9A (major component, Fig. 2) and 0.12 (2) Å for atom C11X (minor component, Fig. 3). The dihedral angles they form are 56.31 (5) and 55.2 (3)° for the major and minor components, respectively. Two pairs of intramolecular hydrogen bonds, O3—H3B···O4, O6—H6B···O5 (major component) and O3X—H3XB···O4X, O6X—H6XB···O5X (minor component), generate rings of S(8) graph-set motifs (Table 1; Bernstein *et al.*, 1995). In the crystal packing, intermolecular C—H···O hydrogen interactions (Table 1) link the molecules into chains along the *b* axis (Fig. 4). π — π stacking interactions with centroid-to-centroid distances of 3.594 (2) (major component) and 3.608 (5) Å (minor component) are also observed.

Experimental

To a well-stirred solution of 4-hydroxycoumarin (6.17 mmol, 1.0 g) in ethanol (10 ml) containing two drops of acetic acid, thiophene-3-carboxaldehyde (3.1 mmol, 0.345 g) was added. The reaction mixture was stirred at room temperature for 8 hr. The completion of the reaction was monitored by TLC. After the reaction was completed, the crystallized solid was separated out, filtered, washed with ethanol and dried. The isolated product was further purified by recrystallization from a chloroform / methanol mixture (1:1 *v/v*) to give the pure title compound in 70% yield.

Refinement

The whole molecule is disordered over two positions with refined occupancy ratio of 0.873 (1):0.127 (1). The same U_{ij} parameters were applied to the S1/S1X, C20/C20X and C22/C22X pairs. Distance and rigid body restrain were used. All H atoms were positioned geometrically and refined using a riding model, with O—H = 0.82 Å, C—H = 0.93–0.98 Å, and with $U_{iso} = 1.2 U_{eq}(C)$ or $1.5 U_{eq}(O)$.

Figures

Fig. 1. The molecular structure of the title compound showing a whole molecule disordered over two orientations.

Fig. 2. The molecular structure of the major component of the title compound, showing 30% probability displacement ellipsoids. Intramolecular hydrogen bonds are shown as dashed lines.

Fig. 3. The molecular structure of the minor component of the title compound, showing 30% probability displacement ellipsoids. Intramolecular hydrogen bonds are shown as dashed lines.

Fig. 4. The crystal packing of the title compound viewed along the *c* axis. H atoms not involved in the hydrogen bonding interactions (dashed lines) are omitted for clarity. Only the major component of disorder is shown.

Refinement

Refinement on F^2 Primary atom site location: structure-invariant direct methods
 Least-squares matrix: full Secondary atom site location: difference Fourier map
 $R[F^2 > 2\sigma(F^2)] = 0.044$ Hydrogen site location: inferred from neighbouring sites
 $wR(F^2) = 0.106$ H-atom parameters constrained
 $S = 1.02$ $w = 1/[\sigma^2(F_o^2) + (0.0409P)^2 + 0.2504P]$
 where $P = (F_o^2 + 2F_c^2)/3$
 5420 reflections $(\Delta/\sigma)_{\text{max}} = 0.001$
 524 parameters $\Delta\rho_{\text{max}} = 0.17 \text{ e } \text{\AA}^{-3}$
 252 restraints $\Delta\rho_{\text{min}} = -0.21 \text{ e } \text{\AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F , and R-factors based on ALL data will be even larger.
