Comment

The title compound is a precursor in the synthesis of novel chiral catalysts containing a tetrahydroisoquinoline framework (TIQ). Upon oxidation of the secondary amine, the *N*-oxide form of this compound and its derivatives are currently being tested as novel organocatalysts for asymmetric allylation reactions (Naicker *et al.* 2010).

The structure has two molecules in the asymmetric unit (Fig. 1). These molecules are linked *via* various intermolecular short contact interactions (2.01–2.83 Å). The crystal packing reveals that a hydrogen bond *via* the amide groups N2A—H2A···O1B link the molecules together resulting in a one-dimensional sheet along the *c* axis (Fig. 2), also see (Naicker *et al.* 2011)

From the crystal structure it is evident that the *N*-containing six membered rings assume different conformations for the two molecules in the asymmetric unit (Fig. 1). The ring containing N1A adopts a half chair conformation while N1B exists as a half boat conformation.

Experimental

(S)-2-Benzyl-1,2,3,4-tetrahydroisoquinoline-3-carboxylic acid (1.5 g, 3.4 mmol) was dissolved in dry dichloromethane (15 ml) followed by the addition of triethylamine (2.0 eq.) and ethylchloroformate (1.2 eq.) which was stirred for 1 h at 0 degrees followed by the addition of 2,6-diisopropylaniline (1.1 eq.). The reaction mixture was then stirred at room temperature until no more starting material could be detected by TLC analysis (approximately 3 h). The reaction mixture was poured into water (30 equivalent volumes); the mixture was then extracted twice with dichloromethane (20 ml). The extracts were combined, dried over anhydrous magnesium sulfate and then concentrated to dryness affording the crude product which was purified by silica column chromatography (hexane:ethylacetate 80:20 R_f =0.6).

Melting point 418–420 K. $[\alpha]_D^{20} +4.762$ (*c* 0.14 in CHCl₃).

Refinement

All non-hydrogen atoms were refined anisotropically. All hydrogen atoms were positioned geometrically with C—H distances ranging from 0.95 Å to 1.00 Å and refined as riding on their parent atoms with $U_{\text{iso}}(\text{H}) = 1.2 - 1.5 U_{\text{eq}}(\text{C})$. With unmerged reflections the Flack x parameter equals to -1.3800 with e.s.d. 2.4120.

Special details

Experimental. Half sphere of data collected using the Bruker *SAINTE* software package. Crystal to detector distance = 40 mm; combination of φ and ω scans of 0.5° , 50 s per $^\circ$, 2 iterations.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
