Received 31 March 2011; accepted 8 April 2011

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; disorder in main residue; R factor = 0.050; wR factor = 0.137; data-to-parameter ratio = 12.1.

The title compound, $\text{C}_{11}\text{H}_9\text{F}_3\text{NO}^+\cdot\text{ClO}_4^-\cdot\text{C}_{11}\text{H}_8\text{F}_3\text{NO}$ or $[(\text{C}_{11}\text{H}_8\text{F}_3\text{NO})\text{H}(\text{C}_{11}\text{H}_8\text{F}_3\text{NO})]\text{ClO}_4$, contains two 8-(2,2,2-trifluoroethoxy)quinoline molecules, one of which combines a proton from perchloric acid to form the corresponding quinolinium cation. The quinolinium and quinoline rings form a cationic unit *via* an intermolecular $\text{N}-\text{H}\cdots\text{N}$ hydrogen bond. The heterocyclic units are almost perpendicular to each other [interplanar angle $86.97(6)\text{ }^\circ$]. In the crystal, each perchlorate anion bridges two adjacent cationic units and creates a chain by a combination of $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds. Two inversion-related chains associate into a molecular column by $\pi-\pi$ stacking interactions between the quinolinium rings. The perpendicular and centroid–centroid distances between adjacent quinolinium rings are $3.501(3)$ and $3.634(9)\text{ \AA}$, respectively. The molecular column is linked to its neighbors, creating a two-dimensional network *via* the weak $\pi-\pi$ stacking between the quinoline rings [perpendicular and centroid–centroid separations $3.340(4)$ and $4.408(4)\text{ \AA}$, respectively]. Finally, a three-dimensional framework is formed by a combination of intermolecular $\text{C}-\text{F}\cdots\pi$ contacts. One $-\text{CF}_3$ group is disordered over two positions of equal occupancy.

8-(2,2,2-Trifluoroethoxy)quinolinium perchlorate-8-(2,2,2-trifluoroethoxy)quinoline (1/1)

J. Wu, L.-S. Chen, Q.-K. Liu and D.-S. Guo

Comment

Molecules containing quinoline moieties have attracted much interest due to their significant bioactivities (Moret *et al.*, 2006) and potential applications for constructing supramolecular systems by various hydrogen bonds and π - π interactions (Kalita *et al.*, 2009). Numerous crystal structures of 8-substituted quinolines, most of which are 8-alkyloxyquinoline derivatives have been reported (Karmakar *et al.*, 2009; Al-Mandhary *et al.*, 2003; Zhang *et al.*, 2006; Zheng *et al.*, 2006), while the crystal structures of such compounds exhibiting fluorinated alkyl groups have rarely been described. We synthesized a new trifluoroethoxyquinoline derivative and attempted to prepare its Ni(II)-complex. Surprisingly, a complex without the Ni(II) ion, namely 8-(2,2,2-trifluoroethoxy)-quinolinium-[8-(2,2,2-trifluoroethoxy)-quinoline] perchlorate, was obtained. Here, we report its crystal structure.

In the crystal structure of the title complex the asymmetric unit contains one perchlorate anion and one organic cation consisting of two 8-(2,2,2-trifluoroethoxy)-quinolines and a proton (Fig. 1). In the cationic unit, one quinoline ring is protonated forming a quinolinium and is connected to the other one *via* a N—H \cdots N hydrogen bond (N—H \cdots N angle 155.33 (5) $^\circ$, N1 \cdots N2 2.684 (3) Å, Fig. 2, Table 1). This distance is shorter than 2.729 Å reported for a similar quinoline derivative (Ouyang *et al.*, 1998). Such a short distance may be ascribed to the presence of two weak C—F \cdots π contacts (Prasanna & Row, 2000; Saraogi *et al.*, 2003; Choudhury & Row, 2004) between the non-disordered trifluoromethyl group and the quinoline ring. Separations of F5 \cdots Cg1 and F6 \cdots Cg2 (Cg1 and Cg2 are the centroids of N1—C5 and C5—C9 bonds, respectively) are 3.099 (3) and 3.166 (3) Å, respectively. The quinolinium and quinoline rings are almost perpendicular to each other, with a dihedral angle of 86.97 (6) $^\circ$. The other trifluoromethyl group is disordered over two orientations, with refined site-occupancy factors of 0.5.

In the packing of the title complex, there exist intermolecular C—H \cdots O hydrogen bonds, C—F \cdots π contacts (Table 1) and π - π stackings (Kalita & Baruah, 2010; Chen *et al.*, 2005; Liang *et al.*, 2002). The cationic units are alternately bridged by perchlorate anions with intermolecular C—H \cdots O hydrogen bonds and form an infinite one-dimensional chain along the *c* axis (Fig. 3). Hydrogen bonds arise from atoms C13—H13 and C21—H21B in the molecule at (*x*, *y*, *z*) acting as hydrogen bond donors towards atoms O3 at (*x* + 1, -*y* + 1, -*z* + 1) and O4 (-*x* + 1, -*y* + 1, -*z* + 2), respectively. Two adjacent chains running along the alternate orientation are further combined to a molecular column by π - π stacking interactions between the quinolinium rings, with perpendicular and centroid-centroid distances of 3.501 (3) and 3.634 (9) Å, respectively, between neighboring phenyl rings of the quinolinium units. Finally, a complicated three-dimensional framework is formed by a combination of C—F \cdots π contacts, with a F5 \cdots Cg3 (Cg3 is the centroid of C17—C18 bond) distance of 3.240 (7) Å (Table 1), and weak π - π stackings between adjacent phenyl rings of the quinoline moieties, with perpendicular and centroid-centroid separations of 3.340 (4) and 4.408 (4) Å, respectively.

Experimental

A suspension of 8-hydroxyquinoline (0.200 g, 1.378 mmol), anhydrous KOH (0.093 g, 1.657 mmol) and 2,2,2-trifluoroethyl-4-methylbenzenesulfonate (0.385 g, 1.514 mmol) in dry NMP (5 ml) was stirred for 5 h at 393 K and then cooled to

supplementary materials

room temperature. The resulting mixture was neutralized with 5% aqueous HCl and extracted with CH₂Cl₂. The organic layer was separated and washed with saturated sodium hydrogen carbonate and brine, and dried over anhydrous MgSO₄. Removal of the solvent under reduced pressure gave 8-(2,2,2-trifluoroethoxy)-quinoline as a yellow solid (yield 73%), which was purified by flash column chromatography (EtOAc/petroleum ether = 1:3, *R*_F = 1/2).

Single crystals of the title complex suitable for X-ray analysis were obtained from a solution of Ni(ClO₄)₂ (0.013 g, 0.050 mmol) in MeOH (1 ml) which was layered onto a solution of 8-(2,2,2-trifluoroethoxy)-quinoline (0.012 g, 0.053 mmol) in CH₂Cl₂ (1 ml) at 298 K.

Refinement

All non-hydrogen atoms were refined with anisotropic displacement parameters. Hydrogen atoms attached to anisotropically refined atoms were placed in geometrically idealized positions and included as riding atoms with C—H = 0.93 Å and *U*_{iso}(H) = 1.2*U*_{eq}(C) (aromatic); C—H = 0.97 Å and *U*_{iso}(H) = 1.2*U*_{eq}(C) (methylene); N—H = 0.86 Å and *U*_{iso}(H) = 1.2*U*_{eq}(N). In the title molecule, one trifluoromethyl group was disordered over two orientations, with refined site occupation factors of 0.5: 0.5.

Figures

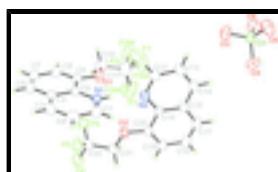

Fig. 1. Molecular structure of the title complex, with displacement ellipsoids drawn at the 30% probability level.

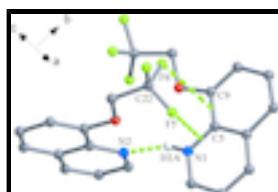

Fig. 2. Hydrogen-bonded cationic unit, with weak C—F···π contacts. For the sake of clarity, the disordered moieties and the H atoms not involved in hydrogen bonding have been omitted.

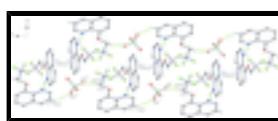

Fig. 3. Molecular column formed by hydrogen bonds and π-π stackings, viewed along the *a* axis. The disordered moieties and H atoms not involved in hydrogen bonding have been omitted for clarity. [Symmetry codes: (i) -*x* + 1, -*y* + 1, -*z* + 1; (ii) -*x* + 1, -*y* + 1, -*z* + 2].

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.050$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.137$	H-atom parameters constrained
$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.068P)^2 + 0.293P]$
4364 reflections	where $P = (F_o^2 + 2F_c^2)/3$
361 parameters	$(\Delta/\sigma)_{\text{max}} < 0.001$
0 restraints	$\Delta\rho_{\text{max}} = 0.25 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.27 \text{ e \AA}^{-3}$

Special details

Experimental. ^1H NMR (300 MHz, CDCl \sim 3~): δ 8.97 (*dd*, 1H, $J = 4.04$ Hz, 1.52 Hz), 8.17 (*d*, 1H, $J = 7.52$ Hz), 7.54–7.44 (*m*, 3H), 7.25 (*d*, H, $J = 7.65$ Hz), 4.78 (*q*, 2H, $J = 8.33$ Hz).

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
