Received 9 April 2011; accepted 21 April 2011

Key indicators: single-crystal X-ray study; T = 293 K; mean $\sigma(C-C) = 0.003$ Å; R factor = 0.052; wR factor = 0.148; data-to-parameter ratio = 15.1.

In the title compound, $C_{12}H_{12}N_6\cdot 4H_2O$, the two triazole rings adopt a *cis* configuration with a crystallographic twofold axis passing through the central benzene group. The benzene and triazole rings are almost coplanar with a dihedral angle of 5.5 (1)°. In the crystal, water molecules are joined together by $OW-H\cdots OW$ hydrogen bonds to form a one-dimensional zigzag chain. These water chains are further connected to the organic molecule, forming a three-dimensional network by intermolecular $OW-H\cdots N$ and $N-H\cdots OW$ hydrogen bonds. Moreover, $\pi-\pi$ stacking interactions between triazole rings [centroid–centroid distances = 3.667 (1)–3.731 (1) Å] are observed. One of the water molecules shows one of the H atoms to be disordered over two positions.

1,4-Bis(5-methyl-1*H*-1,2,4-triazol-3-yl)benzene tetrahydrate

A.-X. Zhu, X.-L. Chen, Z. Li, Y.-C. Du and H.-C. Wang

Comment

In the past few years, 1,2,4-triazole and its derivatives have attracted increasing attention as *N*-heterocyclic aromatic ligands, since they are effective bridging ligands combining the coordination modes of both imidazoles and pyrazoles. In addition, metal-triazolate frameworks have demonstrated high thermal and chemical stabilities, and interesting luminescent, magnetic and gas-adsorption properties (Zhang *et al.* 2005; Ouellette *et al.* 2006; Zhu *et al.* 2009). However, there are rare crystal structure reports of 1,2,4-triazole derivatives attached to aromatic groups (Passaniti *et al.* 2002). Although the synthesis of the title compound 1,4-bis(5-methyl-1*H*-1,2,4-triazol-3-yl)benzene has been reported by Bahçeci *et al.* (2005), no crystal-lographic study has been reported on this ligand and related metal coordination compounds. We reported herein another synthetic method and the crystal structure of the title compound.

The asymmetric unit of the title compound contains one-half organic molecule, which adopts a *cis*-configuration with a crystallographic mirror plane passing through the central benzene group, and two water molecules (Fig. 1). The bond lengths and angles are within normal ranges in accordance with the corresponding values reported (Passaniti *et al.* 2002). The benzene and the triazole rings are almost coplanar, with a dihedral angle of 5.4 (1)°. In the crystal structure, water molecules are joined together by OW—H···OW hydrogen bonds to form a one-dimensional zig-zag water chain (Fig. 2, Table 1). These water chains are further connected to the organic molecule producing a three-dimensional network (Fig. 2) by intermolecular OW—H···N and N—H···OW hydrogen bonds (Table 1). Moreover, π - π stacking interactions between triazole rings (centroid-centroid distance = 3.665 (1)–3.732 (1) Å) are observed (Fig. 3).

Experimental

The ligand 1,4-bis(5-methyl-1*H*-1,2,4-triazol-3-yl)benzene was synthesized according to a literature method (Bahçeci *et al.* 2005). Yellow, plate-like single crystals of the title compound are obtained from a solution of 1,4-bis(5-methyl-1*H*-1,2,4-triazol-3-yl)benzene (24 mg, 0.1 mmol) in methanol (1 ml) and water (5 ml) if the solution is placed in a Teflon-lined stainless steel vessel (15 ml), heated at 453 K for 24 h and then cooled to room temperature at a rate of 5 K h⁻¹.

Refinement

All H atoms were placed in idealized positions (O—H = 0.85 Å, N—H = 0.86 Å and C—H = 0.95 Å) and refined as riding atoms with $U_{iso}(H) = 1.2 U_{eq}(C, N)$ and $U_{iso}(H) = 1.5 U_{eq}(O)$. One hydrogen atom from O2W is disordered over two positions in a 0.52 (3):0.48 (3) ratio, which is freely refined with the command 'PART'.

Figures

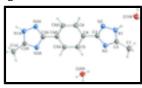

Fig. 1. Molecular structure of the title compound, non-H atoms are depicted as 30% probability displacement ellipsoids.

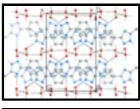

Fig. 2. Packing diagram of the title compound showing the hydrogen bonding interactions as dashed lines. H atoms not involved in hydrogen bondings have been omitted.

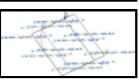

Fig. 3. π - π Stacking interactions between triazole rings, H and O atoms are omitted for clarity.

102 parameters	$\Delta \rho_{max} = 0.27 \text{ e Å}^{-3}$
0 restraints	$\Delta \rho_{\text{min}} = -0.25 \text{ e Å}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger. One hydrogen atom from O2W is disordered over two positions in a 0.52 (3):0.48 (3) ratio, which is freely refined with command 'PART'.
