Received 17 April 2011; accepted 27 April 2011

Key indicators: single-crystal X-ray study;  $T = 293$  K; mean  $\sigma(C-C) = 0.008$  Å; disorder in main residue;  $R$  factor = 0.038;  $wR$  factor = 0.099; data-to-parameter ratio = 12.7.

The polymeric title compound,  $[Ce(C_7H_3N_2O_6)_3(C_2H_6OS)_2]_n$ , exists as a linear chain along [111] as the three dinitrobenzoate anions each engages in bridging adjacent dimethyl sulfoxide (DMSO) coordinated Ce<sup>III</sup> atoms. The metal atoms are surrounded by eight O atoms in a square-antiprismatic environment. There are two independent formula units in the asymmetric unit. The S atoms of two of the four DMSO molecules are disordered in a 0.926 (3):0.074 (3) ratio.

### Comment

The background to the class of rare-earth 3,5-dinitrobenzoates is given in a report on  $\text{Pr}(\text{C}_7\text{H}_3\text{N}_2\text{O}_6)_3(\text{C}_2\text{H}_6\text{OS})_2$  (Niu *et al.*, 2001). The DMSO used in the synthesis is incorporated into the crystal structure; DMF in other similar syntheses is also incorporated in the product. The title  $\text{Ce}^{\text{III}}$  analog (Scheme I) is isostructural, the two compounds crystallizing with matching cell dimensions. Polymeric  $\text{Ce}(\text{C}_7\text{H}_3\text{N}_2\text{O}_6)_3(\text{C}_2\text{H}_6\text{OS})_2$  exists as a linear chain as the three dinitrobenzoate anions each engages in bridging adjacent DMSO-coordinated  $\text{Ce}^{\text{III}}$  atoms (Fig. 1 and Fig. 2). The metal atoms are surrounded by eight O atoms in a square-antiprismatic environment (Fig. 3).

### Experimental

3, 5-Dinitrobenzoic acid (0.434 g) was heated in water (50 ml) at 333 K until it dissolved. Cerium trinitrate hexahydrate (0.442 g) was added followed by dimethyl sulfoxide (4 ml). The solution was heated for 5 h. The solution was filtered and the filtrate evaporated to dryness. The white product was recrystallized from ethanol to furnish colorless prismatic crystals.

### Refinement

Carbon-bound H-atoms were placed in calculated positions ( $\text{C}-\text{H}$  0.93 to 0.97 Å) and were included in the refinement in the riding model approximation, with  $U(\text{H})$  set to 1.2–1.5 $U(\text{C})$ .

The two DMSO molecules connected to Ce1 are both disordered over two positions in a 93 (1): 7 ratio in respect of the S atoms only. For each molecule, the temperature factors of the primed atom were set to those of the unprimed ones; the anisotropic temperature factors were restrained to be nearly isotropic. Each C–S and C–S' (as well O–S and O–S') pair of bonds were restrained to within 0.01 Å of each other. Their carbon atoms are ordered; however, because of the disordered S atoms, each C atom carries two sets of H-atoms. The ratio of the occupancies is that of the ratio for the S atoms, *i.e.*, 93: 7.

### Figures

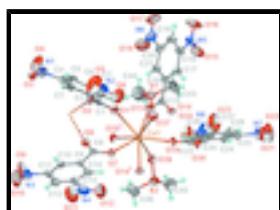

Fig. 1. Thermal ellipsoid plot (Barbour, 2001) of a portion of the polymeric chain of  $\text{Ce}(\text{C}_7\text{H}_3\text{N}_2\text{O}_6)_3(\text{C}_2\text{H}_6\text{OS})_2$  at the 50% probability level; hydrogen atoms are drawn as spheres of arbitrary radius. The disorder is not shown. Symmetry code:  $i = 1 - x, 1 - y, 1 - z$ .
