Key indicators: single-crystal X-ray study;  $T = 125$  K; mean  $\sigma(C-C) = 0.002$  Å;  $R$  factor = 0.018;  $wR$  factor = 0.045; data-to-parameter ratio = 28.3.

The title complex,  $[NaRuCl_4(C_4H_4N_2)(C_2H_6OS)_2]_n$ , is the sodium salt of monoanionic octahedral  $[Ru^{III}Cl_4(\text{pyrimidine})-(\text{DMSO})]^-$  in which the sulfur-bound dimethyl sulfoxide (DMSO) and pyrimidine ligand are oriented *trans* to one another on the Ru<sup>III</sup> atom. The average of the four Ru—Cl bond lengths is 2.355 (15) Å, and the Ru—S and Ru—N bond lengths are 2.2853 (3) and 2.1165 (11) Å, respectively. The complex forms a chain, with a six-coordinate sodium ion bridging the ruthenium(III) units. The sodium cation is coordinated by *cis*-chloride ligands on ruthenium [Na—Cl = 2.9576 (7) and 2.6988 (7) Å], chloride and DMSO ligands from the ruthenium complexes related by inversion [Na—Cl and Na—O = 2.8888 (7) and 2.2623 (12) Å, respectively], a nitrogen ligand from the pyrimidine of the tetrachloridoruthenium(III) complex related by the twofold rotation axis [Na—N = 2.5224 (14) Å] and an oxygen-bound DMSO [Na—O = 2.3165 (12) Å].

**Comment**

Ruthenium complexes are thought to be good candidates for the next generation of metal-based anti-cancer agents following the very successful platinum complexes whose most famous example is cisplatin; platinum complexes struggle with general toxicity, drug resistance, and lack of water solubility (Kostova, 2006; Antonarakis & Emadi, 2010; Silva, 2010). For synthesis of ruthenium precursors see: Alessio *et al.* (1991) and Jaswal *et al.* (1990).

The title complex exhibits a nearly octahedral coordination geometry at ruthenium, and the dimethyl sulfoxide (DMSO) coordinated sodium cation is associated with the complex *via* *cis*-chloride ligands (Fig. 1). The sulfur-bound DMSO and pyrimidine ligands are *trans*, with Ru1—S1 and Ru1—N1 bond distances of 2.2853 (3) Å and 2.117 (1) Å, respectively, and an average Ru1—Cl distance of 2.35 (2) Å. The Ru1—Cl, Ru1—S1 and Ru1—N1 distances are very similar to those found in three related  $\text{RuCl}_4(\text{DMSO})^{-1}$  structures containing the aromatic nitrogen donor ligand pyrazine,  $[\text{Na}][\text{RuCl}_4(\text{pyrazine})(\text{DMSO})]$  (Anderson *et al.*, 2007),  $\text{Na}_2[\text{trans},\text{cis},\text{trans}-\text{Ru}^{\text{III}}\text{Cl}_4(\text{DMSO})(\mu\text{-pyrazine})]_2\text{Pt}^{\text{II}}\text{Cl}_2$ , and  $(\text{tetraphenylphosphonium})_2[\text{trans},\text{trans},\text{trans}-\text{Ru}^{\text{III}}\text{Cl}_4(\text{DMSO})(\mu\text{-pyrazine})]_2\text{Pt}^{\text{II}}\text{Cl}_2$  (Herman *et al.*, 2008). The Ru—Cl bond distances are also similar to other Ru(III) tetrachloro complexes containing electron withdrawing ligands such as CO (Alessio *et al.*, 1995) or nitroimidazole (Anderson & Beauchamp, 1995). The dimeric species  $\text{Na}_2[\text{trans},\text{trans}-\text{Ru}^{\text{III}}\text{Cl}_4(\text{DMSO})]_2(\mu\text{-pyrimidine})$  (Iengo *et al.*, 1999) and the monomeric species  $\text{Na}[\text{trans}-\text{Ru}^{\text{III}}\text{Cl}_4(\text{DMSO})(\text{imidazole})]$  (Alessio *et al.*, 1993) show a similar coordination around the ruthenium centers.

The six-coordinate, distorted octahedral sodium cation acts to bridge the ruthenium complex into an infinite one-dimensional chain (Fig. 2). On each Ru center, *cis*-chloride ligands coordinate to sodium with Na1—Cl2 and Na1—Cl3 distances of 2.9576 (7) Å and 2.6988 (7) Å, respectively. A centrosymmetric dimer is formed by additional sodium coordination to Cl2<sup>i</sup> and the DMSO oxygen O1<sup>i</sup> of the neighboring ruthenium complex, with Na1—Cl2<sup>i</sup> distance of 2.8888 (7) Å and Na1—O1<sup>i</sup> distance of 2.262 (1) Å. The dimer is linked into an infinite one-dimensional chain by further coordination of the sodium ion to nitrogen N2<sup>ii</sup> of the pyrimidine lignd of the ruthenium complex related by the twofold rotation axis with a Na1—N2<sup>ii</sup> bond distance of 2.522 (1) Å. The final coordination site of the octahedral sodium ion is occupied by a molecule of DMSO, with Na1—O2 length 2.317 (1) Å. This infinite one-dimensional chain with the sodium cation acting as a bridge is similar to the related structure  $[\text{Na}][\text{RuCl}_4(\text{pyrazine})(\text{DMSO})]$  (Anderson *et al.*, 2007), the difference being the slight twist observed in the pyrimidine complex due to the *meta* nitrogen donor atoms as opposed to a more linear case for the pyrazine complex with the *para* nitrogen donor atoms.

---

## Experimental

The title complex was prepared by mixing a solution of  $[\text{Na}][\text{RuCl}_4(\text{DMSO})_2]$  in acetone/DMSO (10:1) with an acetone solution of pyrimidine in fivefold excess. The resulting solution was mixed for several hours and then placed at 5 °C for several days. Large block-like crystals appeared; one was taken for X-ray diffraction studies. The others were used for spectroscopic characterization. For similar spectroscopic results see Anderson *et al.*, (2007). Selected IR ( $\text{cm}^{-1}$ ): 1596 (pyrimidine), 1085 s (DMSO-S), 431 m (Ru-S). Selected  $^1\text{H}$  NMR: ( $\text{D}_2\text{O}$ /p.p.m.): -13.9 (br, DMSO-S), 5.15 (pyrimidine H); -0.85 (br, pyrimidine H).

## Refinement

All non-hydrogen atoms were refined anisotropically. Hydrogen atoms on carbon were included in calculated positions and refined using a riding model at C-H = 0.95 or 0.98 Å and  $U_{\text{iso}}(\text{H}) = 1.2$  or  $1.5 \times U_{\text{eq}}(\text{C})$  of the aryl and methyl C-atoms, respectively. The extinction parameter (EXTI) refined to zero and was removed from the refinement.

## Figures

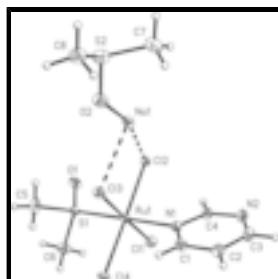

Fig. 1. A view of the title compound, with displacement ellipsoids shown at the 50% probability level.

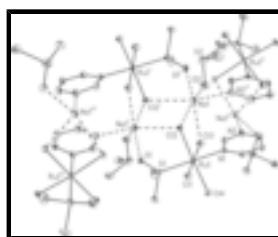

Fig. 2. A view of the one-dimensional chain with displacement ellipsoids shown at the 50% probability level. Hydrogen atoms have been removed for clarity. [Symmetry codes: (i)  $-x + 1$ ,  $-y$ ,  $-z + 1$ ; (ii)  $-x + 1$ ,  $y$ ,  $-z + 1/2$ ; (iii)  $x$ ,  $-y$ ,  $z + 1/2$ ].

$R[F^2 > 2\sigma(F^2)] = 0.018$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.045$	H-atom parameters constrained
$S = 1.07$	$w = 1/[\sigma^2(F_o^2) + (0.0191P)^2 + 1.3448P]$ where $P = (F_o^2 + 2F_c^2)/3$
5227 reflections	$(\Delta/\sigma)_{\text{max}} = 0.003$
185 parameters	$\Delta\rho_{\text{max}} = 0.61$ e Å $^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.87$ e Å $^{-3}$

### Special details

**Experimental.** A suitable crystal was mounted in a nylon loop with Paratone-N cryoprotectant oil and data was collected on a Bruker *APEX II* CCD platform diffractometer. The structure was solved using direct methods and standard difference map techniques, and was refined by full-matrix least-squares procedures on  $F^2$  with *SHELXTL* Version 6.14 (Sheldrick, 2008).

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
