Correspondence e-mail: ce.strasser@gmx.net

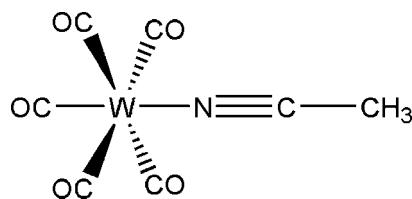

Received 29 April 2011; accepted 11 May 2011

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(\text{C}-\text{C}) = 0.006 \text{ \AA}$; R factor = 0.022; wR factor = 0.055; data-to-parameter ratio = 15.4.

The acetonitrile ligand in the title compound, $[\text{W}(\text{CH}_3\text{CN})(\text{CO})_5]$, is coordinated end-on to a pentacarbonyltungsten(0) fragment with a $\text{W}-\text{N}$ bond length of $2.186(4) \text{ \AA}$, completing an octahedral coordination environment around the W atom.

(Acetonitrile- κ N)pentacarbonyltungsten(0)

C. E. Strasser, S. Cronje and H. G. Raubenheimer

Comment

The title compound is an important starting material in the synthesis of complexes containing the pentacarbonyltungsten(0) fragment. The nitrile ligand is coordinated end-on to W(CO)₅, completing an octahedral coordination geometry at the tungsten atom.

The *trans*-influence of the acetonitrile ligand is echoed by the comparatively short W1—C11 bond [1.975 (5) Å] compared to the *cis*-carbonyls [W—C bond lengths 2.023 (5) Å to 2.056 (5) Å].

When the present molecular structure of [W(CH₃CN)(CO)₅] is compared to other literature examples of (nitrile- κ N)pentacarbonyltungsten(0) compounds, surprisingly no significant variations in bond lengths can be observed within the metal–ligand bonds despite different electronic and steric properties of the nitriles used. Related crystal structures reported include the W(CO)₅ adducts of alkynitriles (Reibenspies *et al.*, 1994; Jefford *et al.*, 1996), conjugated nitriles (Fischer *et al.*, 1993; Tang *et al.*, 1999; Cordiner *et al.*, 2006; Helten *et al.*, 2010), α -metal-substituted alkyl nitriles (Busetto *et al.*, 1992; Trylус *et al.*, 1999) as well as deprotonated 2,3,4-tricyanopent-2-enedinitrile (Duclos *et al.*, 1999).

Experimental

The compound was obtained as a side product after chromatography of a mixture obtained by treating pentacarbonyl[(4-methyl-1,3-thiazol-2-yl)carbonyl]tungsten(0) with bis(trichloromethyl)carbonate (Strasser *et al.*, 2010). Decomposition of the initial product followed by reaction of the pentacarbonyltungsten fragment with acetonitrile in the mobile phase resulted in formation of the title compound. Crystals of the title compound were formed by layering a dichloromethane solution with hexane.

Refinement

All H atoms were positioned geometrically (C—H = 0.98 Å) and constrained to ride on their parent atoms; the U_{iso} (H) values were set at 1.5 times U_{eq} (C).

The maximum residual electron density of 1.69 e Å⁻³ is located 0.85 Å next to W1.

0 restraints	$\Delta\rho_{\min} = -1.08 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
