Received 18 May 2011; accepted 19 May 2011

Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.003$ Å;
R factor = 0.038; *wR* factor = 0.120; data-to-parameter ratio = 16.5.

The V^V atom in the polymeric title compound, [NaV(C₁₅H₁₃N₃O₃)O₂(H₂O)₂]_n, is *O,N,O'*-chelated by the Schiff base dianion and is five-coordinated in a trigonal-bipiramidal coordination geometry. The oxide O atoms occupy the equatorial sites and one oxide O atom is connected to the Na⁺ atom. The ligand simultaneously *O,O'*-chelates to the water-coordinated Na⁺ atom; its coordination number is seven owing to an Na⁺–N_{pyridyl} bond. The two independent formula units, which are disposed about a false center of inversion, are connected into a layer. Adjacent layers are consolidated into a three-dimensional network by O–H···O and O–H···N hydrogen bonds.

Poly[μ -aqua-aqua{ μ -6-ethoxy-2-[(2-isonicotinoylhydrazinylidene)methyl]phenolato- $\kappa^3 O,N,O'$ }dioxidosodiumvanadate(V)]

H. W. Wong, K. M. Lo and S. W. Ng

Comment

Schiff bases derived from condensation of isonicotinoyl hydrazide and *o*-vanillin type of aromatic aldehydes function as tridentate chelates towards a large number of metal ions. For the dioxovanadium(V) species in particular, the dianionic nature of the deprotonated ligand requires a monocationic species to balance the charges. Isonicotinic acid (2-hydroxy-3-ethoxybenzylidene)hydrazide reacts with vanadyl(IV) sulfate in the presence of sodium acetate to yield the title vanadium(V) derivative, $[\text{NaVO}_2(\text{H}_2\text{O})_2(\text{C}_{15}\text{H}_{13}\text{N}_3\text{O}_2)]_n$ (Scheme I, Fig. 1). The V^V atom is *O,N,O'*-chelated by the Schiff base dianion, and is five-coordinate in a trigonal bipyramidal geometry. The oxo O atoms occupy equatorial sites; one oxo O atom is connected to the Na^I atom. The ligand simultaneously *O,O'*-chelates to the water-coordinated Na^I atom; its coordination number is seven owing to an Na···N_{pyridyl} bond. The two independent formula units are connected into a layer. Adjacent layers are consolidated into a three-dimensional network by O—H···O and O—H···N hydrogen bonds (Table 1).

Dioxovanadates(V) based on similar Schiff bases whose negative charge is also balanced by a monovalent cation have been reported before (Lippold *et al.*, 2000; Plass *et al.*, 2000; Plass & Yozgatli; 2003).

Experimental

The Schiff base was synthesized by using a literature procedure (Georgieva & Gadjeva, 2002) that involved condensing isonicotinic acid hydrazide (1 g, 7.5 mmol) and 3-ethoxysalicyldehyde (1.25 g, 7.5 mmol) in ethanol. The compound (1 g, 3.5 mmol), vanadyl(IV) sulfate (0.57 g, 3.5 mmol) and sodium acetate (0.3 g, 3.5 mmol) along with ethanol (100 ml) were heated for 4 h. The solution was filtered and light brown crystals were obtained upon slow cooling of the solvent.

Refinement

H atoms were placed in calculated positions (C—H 0.95 to 0.98, O—H 0.84 Å) and were included in the refinement in the riding model approximation, with *U*(H) set to 1.2 to 1.5 *U*(C,O). The water molecule that is connected to two Na atoms was treated as a methylene type whereas the water that is coordinated to only one Na atom was treated as a methyl type, but with the occupancy of one H atom being zero; H···H distances are a little longer than 2.0 Å.

Figures

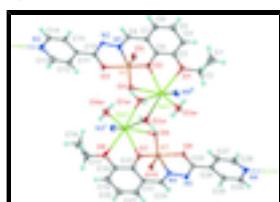

Fig. 1. Thermal ellipsoid plot (Barbour, 2001) of a portion of the layer structure of $[\text{NaVO}_2(\text{H}_2\text{O})_2(\text{C}_{15}\text{H}_{13}\text{N}_3\text{O}_2)]_n$ at the 70% probability level; hydrogen atoms are drawn as spheres of arbitrary radius.
