Received 26 April 2011; accepted 27 April 2011

Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$ ;  $R$  factor = 0.047;  $wR$  factor = 0.107; data-to-parameter ratio = 16.7.

In the title compound,  $\text{C}_9\text{H}_{12}\text{BrNO}_3\text{S}$ , the two tetrahydrofuran rings adopt envelope conformations, the pyrrolidine ring adopts a half-chair conformation and the six-membered ring is in a boat conformation. In the crystal, weak intermolecular  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds link the molecules into  $R_2^2(8)$  and  $R_2^2(14)$  rings along the  $b$ -axis direction.

**E. Temel, A. Demircan, H. Arslan and O. Büyükgüngör**

#### Comment

Sulfonamides are one of the most important groups of compounds for the medical purposes (Kleemann *et al.*, 1999). They have mostly been applied for the treatment of bacterial infection (Cremlyn, 1996). Sulfonamide is not only an early class of antibiotics, also, has showed different functionality such as a protease inhibitor amprenavir, the analgesic celecoxib, sildenafil for erectile dysfunction, and the antimigraine agent sumatriptan. The most sulfonamides have been synthesized from a reaction between a sulfonyl chloride and ammonia or primary or secondary amines or *via* related transformations (Anderson, 1979).

Several thermal intramolecular Diels Alder reaction of furans (IMDAF) cycloadditon were performed including a nitrogen linked side chain of furan and already reported by Demircan and his co-workers (Demircan and Parsons, 2002; Arslan *et al.*, 2008). We would like to report here a newly synthesized sulfonamide, I.

In continuation of our interest, mesyl group in the structure is normally chosen as a protective group for nitrogen, but at the same time, accelerates the cycloaddition process for IMDAF (Greene, 1981; Choony *et al.*, 1997). This facile, versatile and environmentally friendly reaction was accomplished in aqueous condition and stirred for two days at 372 K.

The molecular structure of the title compound, I, is shown in Fig. 1. All bond lengths show normal values (Allen *et al.*, 1987). In addition, the C—Br bond distance, 1.953 (4) Å, is not significantly different from the value reported for C—Br single bond (1.961 (3) Å; Koşar *et al.*, 2006). The six membered ring, C1—C6, is in a boat conformation with puckering parameter  $Q = 0.933$  (5) Å,  $\theta = 89.1$  (3) °,  $\varphi = 119.1$  (3) °. The tetrahydrofuran, O1/C3—C6, and bromo-attached tetrahydrofuran, O1/C3/C2/C1/C6, rings adopt envelope conformations, and the puckering parameter  $Q$  values are 0.517 (5) and 0.607 (4) Å, respectively (Cremer & Pople, 1975). The pyrrolidine ring, N1/C7/C6/C1/C8, adopts half chair conformation, and the puckering parameter  $Q = 0.368$  (4) Å and  $\varphi = 304.8$  (7) °, (Cremer & Pople, 1975).

Fig. 2 shows the packing of the molecules in the unit cell. The crystal packing of (I) is stabilized by intermolecular C9—H9A···O2 and C9—H9C···O1 interactions (Table 1). The methyl group in the reference molecule at ( $x, y, z$ ) acts as double hydrogen bond donor, *via* H9A and H9C, to atoms O2 in the molecule at ( $-x + 2, -y + 2, -z + 2$ ) and O1 in the molecule at ( $-x + 2, -y + 1, -z + 2$ ), so forming successive  $R^2_2(8)$  and  $R^2_2(14)$  rings running parallel to the [010] direction (Bernstein *et al.*, 1995).

#### Experimental

*N*-(2-bromoprop-2-en-1-yl)-*N*-(2-furylmethyl)methanesulfonamide, II, (1 g, 3.4 mmol) was stirred in water (25 ml) at 372 K for two days (Fig. 3). The reaction was stirred and monitored by thin layer chromatography until no further cycloadditon observed. The mixture was poured into ethylacetate (25 ml) and aqueous phase was washed with excess of ethyl acetate ( $2 \times 25$  ml). Combined organic phases was dried on magnesium sulfate and filtered off. The solvent was then removed under re-

# supplementary materials

duced pressure. The residue was subjected to flash column chromatography to afford the title compound, (*3aR,6S,7aR*)-7a-bromo-2-(methylsulfonyl)-1,2,3,6,7,7a-hexahydro-3a,6-epoxyisoindole, I, with 0.74 g, 74% yield as light brown crystals.

## Refinement

H atoms were positioned geometrically and treated using a riding model, fixing the bond lengths at 0.96, 0.97, 0.98 and 0.93 Å for CH<sub>3</sub>, CH<sub>2</sub>, CH and CH(aromatic), respectively. The displacement parameters of the H atoms were constrained with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}$  (aromatic, methylene or methine C) or  $1.5U_{\text{eq}}$  (methyl C).

## Figures

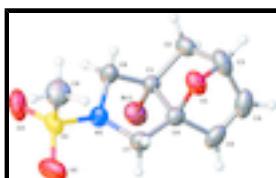

Fig. 1. The molecular structure of the title compound, with displacement ellipsoids drawn at the 30% probability level.

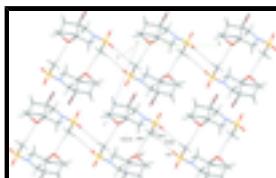

Fig. 2. Part of the crystal structure of the title compound, showing the formation of  $R^2_2(8)$  and  $R^2_2(14)$  rings along [010]. Hydrogen bonds are indicated by dashed lines. (Symmetry codes as in Table 1)

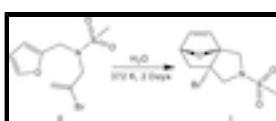

Fig. 3. Synthesis of the title compound.

$V = 553.46 (10) \text{ \AA}^3$	

### Data collection

Stoe IPDS 2 diffractometer	2293 independent reflections
----------------------------	------------------------------

Radiation source: fine-focus sealed tube graphite	1920 reflections with $I > 2\sigma(I)$
Detector resolution: 6.67 pixels mm <sup>-1</sup>	$R_{\text{int}} = 0.082$
rotation method scans	$\theta_{\text{max}} = 26.5^\circ, \theta_{\text{min}} = 2.1^\circ$
Absorption correction: integration ( <i>X-RED</i> ; Stoe & Cie, 2001)	$h = -7 \rightarrow 7$
$T_{\text{min}} = 0.223, T_{\text{max}} = 0.682$	$k = -12 \rightarrow 12$
8163 measured reflections	$l = -13 \rightarrow 13$

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.047$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.107$	H-atom parameters constrained
$S = 1.10$	$w = 1/[\sigma^2(F_o^2) + (0.0452P)^2 + 0.3277P]$
2293 reflections	where $P = (F_o^2 + 2F_c^2)/3$
137 parameters	$(\Delta/\sigma)_{\text{max}} < 0.001$
0 restraints	$\Delta\rho_{\text{max}} = 0.86 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.44 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
