Key indicators: single-crystal X-ray study;  $T = 120\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ;  
 $R$  factor = 0.021;  $wR$  factor = 0.075; data-to-parameter ratio = 14.2.

The asymmetric unit of the title compound,  $C_{18}H_{22}Br_2N_2O_2$ , contains one half-molecule that is related to the other half by a center of inversion located at the mid-point of the central C—C bond. The hydroxy (phenolic) groups are linked to the N atoms by O—H···N hydrogen bonds, which generate  $S(6)$  rings.

### Comment

Recently, we reported the synthesis of a new class of ligands by a ring-opening reduction of bis-1,3-benzoxazines with sodium borohydride (Rivera *et al.*, 2010), and the products of these reactions are referred to as N,N'-disubstituted tetrahydro-salens (Atwood, 1997). Here we report the crystal structure of title compound (**I**). The C( $sp^3$ )—X bond distances and angles in (**I**) are within normal ranges (Allen *et al.*, 1987) and comparable with a related structure (Nazarenko, *et al.*, 2000). The C—N bonds in the N—CH<sub>2</sub>CH<sub>2</sub>—N segment are anti to each other, with a torsion angle of 180°. The observed conformation is stabilized by the short intramolecular hydrogen bonds O—H···N (Table 1), and these interactions generate S(6) ring motifs.

### Experimental

Sodium borohydride (3.0 mmol, 0.11 g) was added to a solution of 3,3'-ethylene-bis-(3,4-dihydro-6-bromo-2H-1,3-benzoxazine) (1 mmol) in ethanol (15 ml), and the mixture was stirred magnetically for 30 min at room temperature. After completion of the reaction, the mixture was poured into ice-cold water, neutralized with ammonium chloride (12 ml), and extracted with CHCl<sub>3</sub> (3 times 10 cm<sup>3</sup>). The combined extracts were dried over anhydrous Na<sub>2</sub>SO<sub>4</sub> and evaporated. The solid obtained was purified by recrystallization from ethanol to yield colourless needles of (**I**).

### Refinement

All hydrogen atoms were discernible in difference Fourier maps and could be refined to reasonable geometry. According to common practice H atoms bonded C atoms were kept in ideal positions with C—H distance 0.96 Å during the refinement. The methyl H atoms were allowed to rotate freely about the adjacent C—C bonds. The hydroxy hydrogen was found in difference Fourier maps and its coordinates were refined freely. The isotropic atomic displacement parameters of hydrogen atoms were evaluated as 1.2× $U_{\text{eq}}$  of the parent atom.

### Figures

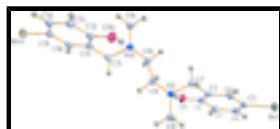

Fig. 1. The molecule of the title compound. Displacement ellipsoids are drawn at 50% probability level. Atoms with suffix i are generated by the symmetry operation (1-x, -y, 2-z).

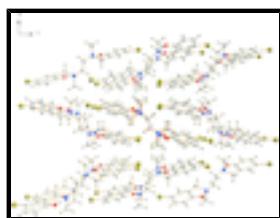

Fig. 2. The packing for (**I**).

### Refinement

Refinement on $F^2$	41 constraints
$R[F^2 > 2\sigma(F^2)] = 0.021$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.075$	Weighting scheme based on measured s.u.'s $w = 1/[ \sigma^2(I) + 0.0016I^2 ]$
$S = 1.52$	$(\Delta/\sigma)_{\text{max}} = 0.008$
1591 reflections	$\Delta\rho_{\text{max}} = 0.20 \text{ e \AA}^{-3}$
112 parameters	$\Delta\rho_{\text{min}} = -0.32 \text{ e \AA}^{-3}$
0 restraints	

### Special details

**Experimental.** CrysAlisPro, Oxford Diffraction (2009), Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

**Refinement.** The refinement was carried out against all reflections. The conventional  $R$ -factor is always based on  $F$ . The goodness of fit as well as the weighted  $R$ -factor are based on  $F$  and  $F^2$  for refinement carried out on  $F$  and  $F^2$ , respectively. The threshold expression is used only for calculating  $R$ -factors etc. and it is not relevant to the choice of reflections for refinement.

The program used for refinement, Jana2006, uses the weighting scheme based on the experimental expectations, see `_refine_ls_weighting_details`, that does not force  $S$  to be one. Therefore the values of  $S$  are usually larger than the ones from the *SHELX* program.
