Received 14 April 2011; accepted 10 May 2011

Key indicators: single-crystal X-ray study;  $T = 298$  K; mean  $\sigma(\text{C}-\text{C}) = 0.003$  Å;  $R$  factor = 0.030;  $wR$  factor = 0.087; data-to-parameter ratio = 8.0.

The title compound,  $C_{14}H_{14}N_2O$ , exists as the enol-imine tautomer. A strong intramolecular hydrogen bond between O and N atoms forms a six-membered ring with an  $S(6)$  graph-set motif, which is approximately coplanar with the phenol ring, the interplanar angle being  $3.4(3)^\circ$ . In the crystal, intermolecular C—H···O hydrogen bonds and N—H···π interactions link the molecules into infinite chains along [100].

### **2-[1-(3-Aminophenylimino)ethyl]phenol**

A. Blagus and B. Kaitner

Comment

Schiff bases are some of the most widely used chelating ligands in the field of metal-organic coordination chemistry (Blagus *et al.*, 2010). The Schiff bases derived from *ortho* hydroxy aldehydes or ketons and aromatic diamines often have photochromic and thermochromic characteristics (Hadjoudis & Mavridis 2004). In this work we report the preparation and the crystal and molecular structure of a novel ketimine Schiff base 2-[1-(3-aminophenylimino)ethyl]phenol (Scheme 1).

The presence of intramolecular O1—H $\cdots$ N1 hydrogen bond [2.540 (2) Å] shows unequivocally that the molecular conformation of compound (1) in the crystalline state is in the enol-imino form. As shown in Figure 2, the Schiff base molecules link mutually in an one-dimensional chain forming a graph-set motif C(5) in the notation of Bernstein *et al.*, (1995) along the [100] direction through a C—H $\cdots$ O [3.243 (3) Å] intermolecular hydrogen bond. Another intermolecular connection between the same neighbouring molecules forms through the terminal primary N2-amino group N—H $\cdots$  $\pi$  interaction [3.457 (3) Å;  $\pi$  refers to the C9—C14 aromatic system centroid]. All bond lengths are within the standard values (Allen *et al.*, 1987) and are comparable with the similar ketimine Schiff bases as cited above (Blagus & Kaitner, 2007).

## Experimental

The title compound was prepared by refluxing a methanolic solution of *m*-phenylenediamine (540 mg, 5 mmol) and 2-hydroxyacetophenone (1.25 ml, 10 mmol) for 4 h at the temperature of 80 °C. The water formed during the reaction was removed by a Dean-Stark trap. After cooling, the brown solid precipitate was filtered. Diffraction quality crystals were obtained by slow evaporation from ether solution.

## Refinement

All N- and O-bound H atoms were located in the difference Fourier map. The position and the isotropic thermal parameters of N-bound H atoms were refined, while the O-bound H atom was treated as riding atom. Aromatic H atoms were placed in calculated positions and treated as riding on their parent C atoms with C—H = 0.93 Å and  $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C})$  for Csp2. In the absence of significant anomalous scattering effects Friedel pairs have been merged.

## Figures

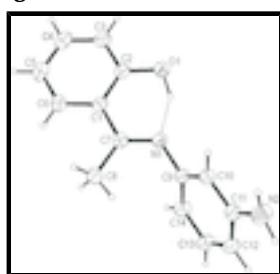

Fig. 1. *ORTEPIII* molecular structure of (I) showing our atom-labelling scheme. Thermal ellipsoids are drawn at the 50% probability level. The intramolecular hydrogen bonds O—H···N is shown as thin line.

### Crystal data

C <sub>14</sub> H <sub>14</sub> N <sub>2</sub> O	<i>F</i> (000) = 480
<i>M<sub>r</sub></i> = 226.27	<i>D<sub>x</sub></i> = 1.280 Mg m <sup>-3</sup>
Orthorhombic, <i>Pca2</i> <sub>1</sub>	Mo <i>Kα</i> radiation, $\lambda$ = 0.71069 Å
Hall symbol: P 2c -2ac	Cell parameters from 1145 reflections
<i>a</i> = 9.0625 (2) Å	$\theta$ = 4–27°
<i>b</i> = 5.5777 (2) Å	$\mu$ = 0.08 mm <sup>-1</sup>
<i>c</i> = 23.2349 (6) Å	<i>T</i> = 298 K
<i>V</i> = 1174.48 (6) Å <sup>3</sup>	Prism, yellow
<i>Z</i> = 4	0.6 × 0.5 × 0.4 mm

### Data collection

Oxford Diffraction Xcalibur CCD diffractometer	1145 reflections with $I > 2\sigma(I)$
Radiation source: fine-focus sealed tube	$R_{\text{int}}$ = 0.016
graphite	$\theta_{\text{max}} = 27.0^\circ$ , $\theta_{\text{min}} = 4.1^\circ$
$\omega$ scans	$h = -11 \rightarrow 11$
6829 measured reflections	$k = -7 \rightarrow 5$
1317 independent reflections	$l = -29 \rightarrow 28$

### Refinement

Refinement on $F^2$	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)]$ = 0.030	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2)$ = 0.087	$w = 1/[\sigma^2(F_o^2) + (0.0469P)^2 + 0.130P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S$ = 1.10	$(\Delta/\sigma)_{\text{max}} < 0.001$
1317 reflections	$\Delta\rho_{\text{max}} = 0.15 \text{ e } \text{\AA}^{-3}$
165 parameters	$\Delta\rho_{\text{min}} = -0.11 \text{ e } \text{\AA}^{-3}$
1 restraint	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001xF_c^2\lambda^3/\sin(2\theta)]^{-1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0.027 (5)

*Special details*

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.

*Hydrogen-bond geometry (Å, °)*

Cg is the centroid of the C9—C14 ring.

<i>D</i> —H··· <i>A</i>	<i>D</i> —H	H··· <i>A</i>	<i>D</i> ··· <i>A</i>	<i>D</i> —H··· <i>A</i>
