Key indicators: single-crystal X-ray study;  $T = 120\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.033;  $wR$  factor = 0.088; data-to-parameter ratio = 12.9.

In the title compound,  $\text{C}_{15}\text{H}_{12}\text{O}_2$ , the dihedral angle between the aromatic ring systems is  $16.67(6)^\circ$ . The methyl C atom is almost coplanar with its attached benzene ring [displacement =  $0.020(2)\text{ \AA}$ ]. In the crystal, the molecules are connected by weak  $\text{C}-\text{H}\cdots\text{O}$  bonds and face-to-edge  $\text{C}-\text{H}\cdots\pi$  interactions between the 2-methoxyphenyl rings.

## 2-(2-Methoxyphenyl)-1-benzofuran

M. Pojarová, M. Dusek, A. Jancarík, E. Makrlík and Z. Sedláková

### Comment

A wide range of natural products with diverse pharmaceutical properties, such as antifungal, antitumor, antiviral, and antimicrobial (Aslam *et al.*, 2006; Galal *et al.*, 2009; Khan *et al.*, 2005), contain a benzofuran ring (Akgul & Anil, 2003; Soekamto *et al.*, 2003). In this paper, we present a crystal structure of the title compound, (I).

The benzofuran unit is essentially planar, with a mean deviation of 0.019 (2) Å from the least-square plane defined by the nine atoms in benzofuran ring. The methoxy group forms intermolecular hydrogen bond to the oxygen in benzofuran ring (Table 1). Another weak interactions found in the crystal is the C—H···π interaction between the 2-methoxyphenyl rings [C3—H3···Cg1 (C2 → C7)] which is responsible for their edge-to-face orientation (Fig. 2).

### Experimental

2-(2'-methoxyphenyl)-benzo[*b*]furan was synthesized by the method described by Takeda (Takeda *et al.*, 2007). Crystals were prepared by slow evaporation from acetonitrile.

### Refinement

The hydrogen atoms were localized from the difference Fourier map. Despite of that, all hydrogen atoms connected to C were constrained to ideal positions. The isotropic temperature parameters of hydrogen atoms were calculated as 1.2\* $U_{\text{eq}}$  of the parent atom.

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger. The hydrogen atoms were localized from the difference Fourier map. Despite of that, all hydrogen atoms connected to C were constrained to ideal positions. The isotropic temperature parameters of hydrogen atoms were calculated as  $1.2 * U_{\text{eq}}$  of the parent atom.
