2-[(Ethoxycarbonothioyl)sulfanyl]acetic acid

Shude Xiao, Renpeng Gu and Paul A. Charpentier*

Department of Chemical and Biochemical Engineering, Faculty of Engineering, The University of Western Ontario, London, Ontario, Canada N6A 5B9 Correspondence e-mail: pcharpentier@eng.uwo.ca

Received 28 March 2011; accepted 10 May 2011

Key indicators: single-crystal X-ray study; T = 150 K; mean σ (C–C) = 0.003 Å; R factor = 0.045; wR factor = 0.111; data-to-parameter ratio = 38.5.

In the title compound, $C_5H_8O_3S_2$, the C–S and C–O bonds in the xanthate unit are shorter than those linked to it. In the crystal, inversion dimers linked by pairs of O–H···O hydrogen bonds occur.

2-[(Ethoxycarbonothioyl)sulfanyl]acetic acid

S. Xiao, R. Gu and P. A. Charpentier

Comment

Reversible-deactivation radical polymerization (RDRP) of vinyl acetate (VAc) has been a challenge. Methyl 2-(ethoxycarbonothioylthio)acetate was investigated for reversible addition-fragmentation chain transfer (RAFT) polymerization of VAc (Moad *et al.*, 2005, 2008; Stenzel *et al.*, 2003; Coote & Radom, 2004), and was successfully applied in emulsion polymerizations (Simms *et al.*, 2005; Russum *et al.*, 2005). Thanks to the similarity of the molecular structures, 2-(ethoxycarbonothioylthio)acetic acid not only provides a carboxylic acid functionality but also works as the RAFT-CTA for VAc in RDRP. This RAFT-CTA has also found applications in the RAFT polymerization of other monomers (Assem *et al.*, 2007; Wang *et al.*, 2010). Compounds of similar structures were reported previously (Xiao & Charpentier, 2010, 2011).

Experimental

Potassium *O*-ethyl dithiocarbonate 13.6 g was dissolved in THF 50 ml, and then mixed with 2-bromoacetic acid 6.9 g / THF 20 ml. The reaction was carried out at room temperature for 2 days. Excess hexanes was applied to the mixture and the precipitates were filtered off, followed by evaporating the solvents using a rotary evaporator. The light yellow oil was further purified by extraction and recrystallization with hexanes, and colorless crystals were obtained. m.p.: 56.4 °C(DSC). MS: 179.9917.

Refinement

The structure was solved and refined using the Bruker *SHELXTL* Software Package, using the space group P 1 21/n 1, with Z = 4 for the formula unit, C₅H₈O₃S₂. All of the non-hydrogen atoms were refined with anisotropic thermal parameters. The hydrogen atom positions were calculated geometrically and were included as riding on their respective carbon atoms. The final anisotropic full-matrix least-squares refinement on F² with 93 variables converged at R1 = 4.54%, for the observed data and wR2 = 11.08% for all data. The goodness-of-fit was 1.005. The largest peak in the final difference electron density synthesis was 0.309 e⁻/Å³ and the largest hole was -0.368 e⁻/Å³ with an RMS deviation of 0.077 e⁻/Å³. On the basis of the final model, the calculated density was 1.462 g/cm³ and F(000), 376 e⁻.

2-[(Ethoxycarbonothioyl)sulfanyl]acetic acid

Crystal data	
$C_5H_8O_3S_2$	F(000) = 376
$M_r = 180.23$	$D_{\rm x} = 1.462 {\rm ~Mg} {\rm ~m}^{-3}$
Monoclinic, $P2_1/n$	Mo <i>K</i> α radiation, $\lambda = 0.71073$ Å
Hall symbol: -P 2yn	Cell parameters from 4468 reflections
a = 4.7387 (2) Å	$\theta = 2.2 - 25.6^{\circ}$
b = 14.7836 (8) Å	$\mu = 0.60 \text{ mm}^{-1}$
c = 11.9013 (6) Å	T = 150 K
$\beta = 100.845 \ (3)^{\circ}$	Cube, colourless
$V = 818.86 (7) \text{ Å}^3$	$0.08\times0.03\times0.03~mm$
<i>Z</i> = 4	

Data collection

3582 independent reflections
2343 reflections with $I > 2\sigma(I)$
$R_{\rm int} = 0.092$
$\theta_{\text{max}} = 35.0^{\circ}, \ \theta_{\text{min}} = 2.2^{\circ}$
$h = -7 \rightarrow 7$
$k = -23 \rightarrow 23$
$l = -19 \rightarrow 18$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.045$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.111$	H-atom parameters constrained
<i>S</i> = 1.01	$w = 1/[\sigma^2(F_o^2) + (0.0294P)^2 + 0.6076P]$ where $P = (F_o^2 + 2F_c^2)/3$
3582 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
93 parameters	$\Delta \rho_{max} = 0.31 \text{ e } \text{\AA}^{-3}$

0 restraints

$$\Delta \rho_{min} = -0.37 \text{ e } \text{\AA}^{-3}$$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted *R*-factor *wR* and goodness of fit *S* are based on F^2 , conventional *R*-factors *R* are based on *F*, with *F* set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating *R*-factors(gt) *etc.* and is not relevant to the choice of reflections for refinement. *R*-factors based on F^2 are statistically about twice as large as those based on *F*, and *R*- factors based on ALL data will be even larger.
