Received 11 May 2011; accepted 11 May 2011

Key indicators: single-crystal X-ray study; $T = 100\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.048; wR factor = 0.130; data-to-parameter ratio = 21.6.

In the title compound, $\text{C}_{21}\text{H}_{22}\text{O}_5$, the mean planes of the pyran and dimethoxyphenyl rings are nearly perpendicular to one another, with the dihedral angle between them being $88.21(8)^\circ$. The pyran ring adopts a boat conformation whereas the two fused cyclohexane rings adopt envelope conformations. In the crystal, molecules are linked into a three-dimensional network by intermolecular $\text{C}-\text{H}\cdots\text{O}$ hydrogen bonds.

Comment

The most important synthetic method for the preparation of substituted alkenes is the condensation reaction between carbonyl compounds with active methylene compounds. Xonotlite, cadmium iodide aluminium oxide and other Lewis acids and bases have been previously used for such type of reactions (Chalais *et al.*, 1985; Prajapati & Sandhu, 1993; Texier-Boullet & Foucaud, 1982; Jone, 1967). In this paper we are reporting the synthesis of title compound (Fig. 1) by simple heating of 1,3-cyclohexanedione with veratraldehyde in acetic acid without the use of any catalyst. The structure is supported by spectral analysis like IR, ^1H NMR, ^{13}C NMR and finally confirmed by *x*-ray crystallography.

In the title compound, the mean plane of pyran ring and the dimethoxyphenyl ring are nearly perpendicular to each other with the dihedral angle between them being $88.21 (8)^\circ$. The dimethoxyphenyl ring is planar with the torsion angle of C20—O4—C18—C19 = $-5.34 (18)^\circ$ and C21—O5—C17—C16 = $-5.67 (18)^\circ$. The two cyclohexane rings adopt envelope conformations [puckering amplitude Q = 0.4284 (16) Å, $\theta = 124.3 (2)^\circ$, $\phi = 359.0 (3)^\circ$; Q = 0.4899 (15) Å, $\theta = 57.91 (18)^\circ$, $\phi = 132.8 (2)^\circ$, whereas the pyran ring adopt a boat conformation [Q = 0.2125 (13) Å, $\theta = 77.9 (4)^\circ$, $\phi = 187.0 (4)^\circ$] (Cremer & Pople, 1975). In the crystal structure, the molecules are linked into a three-dimensional network (Fig. 2) by intermolecular C3—H3A···O4, C5—H5A···O5, C9—H9A···O2, C10—H10B···O5 and C21—H21C···O2 hydrogen bonds (Table 1).

Experimental

A mixture of 1,3-cyclohexanedione (1.12 g m, 10 mmol) and veratraldehyde (1.66 g m, 10 mmol) was heated in 25 ml of glacial acetic acid for three hours. Completion of the reaction was monitored by TLC. The reaction mixture was dried on rotary evaporator under reduced pressure. The crude mixture thus obtained was successively treated with chloroform and ethanol. The ethanol fraction on crystallization furnished cream colored crystals of title compound (yield 90%, m. pt. 216°C). IR (KBr) ν_{max} : 2966, 2933, 2868, 2833, 1664, 1620, 1513, 1441, 1358, 1261, 1240, 1171, 1132, 1025, 956, 906, 859, 807, 726 cm⁻¹. ^1H NMR (300 MHz, DMSO-d₆): δ 1.75–1.88 (m, 2H), 1.94–2.06 (m, 2H), 2.20–2.38 (m, 42H), 2.48–2.68 (m, 4H), 4.21 (s, 1H), 6.78–6.96 (3H, m). ^{13}C NMR (75 MHz, DMSO-d₆): δ 21.6, 26.9, 30.2, 36.6, 56.8, 112.6, 114.4, 115.8, 123.2, 136.4, 146.2, 148.4, 198.2. IR spectrum was taken on Shimadzu IR-408 Perkin Elmer 1800 (FTIR). ^1H NMR was recorded on Bruker Avance 300 MHz with TMS as an internal standard and 75 MHz for ^{13}C NMR. Spectrum was recorded in DMSO-d₆. The melting point was taken on Thermo Fisher digital melting point apparatus of IA9000 series and is uncorrected.

Refinement

All hydrogen atoms were positioned geometrically [C—H = 0.95–1.00 Å] and refined using a riding model, with $U_{\text{iso}}(\text{H}) = 1.2$ or $1.5 U_{\text{eq}}(\text{C})$.

0 restraints	$\Delta\rho_{\min} = -0.28 \text{ e } \text{\AA}^{-3}$

Special details

Experimental. The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
