Received 26 May 2011; accepted 1 June 2011

 Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.010\text{ \AA}$ ;  $R$  factor = 0.056;  $wR$  factor = 0.091; data-to-parameter ratio = 12.8.

In the title compound,  $\{[\text{Zn}(\text{C}_9\text{H}_{10}\text{NO}_3)(\text{C}_{10}\text{H}_8\text{N}_2)_2(\text{H}_2\text{O})]\text{-NO}_3\cdot 2\text{H}_2\text{O}\}_n$ , the  $\text{Zn}^{II}$  atom is six-coordinated in a distorted octahedral geometry by two carboxylate O atoms and one amino N atom from two L-tyrosinate ligands, two N atoms from two 4,4'-bipyridine ligands, and one water molecule. Adjacent Zn atoms are bridged by the bidentate carboxylate groups into a cationic chain extending along [010]. N—H···N, O—H···N and O—H···O hydrogen bonds link the cationic chains, nitrate anions and uncoordinated water molecules into a supramolecular network.  $\pi$ — $\pi$  interactions between the pyridine rings and between the pyridine and benzene rings [centroid–centroid distances = 3.615 (4) and 3.636 (4)  $\text{\AA}$ ] are present.

***catena-Poly[[[aquabis(4,4'-bipyridine- $\kappa$ N)zinc]- $\mu$ -L-tyrosinato- $\kappa^3N,O^1:O^1'$ ] nitrate dihydrate]*****S.-Q. Li and N.-H. Hu****Comment**

There has been considerable interest in chiral coordination polymers, which exhibit potential applications in asymmetric catalysis and chiral separation (Kesanli & Lin, 2003). Self-assembly based on a mixed-ligand system containing both chiral and achiral ligands is an effective approach to the construction of chiral complexes (Dai *et al.*, 2005; Vaidhyanathan *et al.*, 2006; Zaworotko, 2001). Amino acids can be used as chiral building blocks, with their amino and carboxylate groups binding to metal ions in flexible modes (Lou *et al.*, 2005, 2007; Lou & Hong, 2008). We previously reported a chiral two-dimensional coordination polymer,  $[Cu_2(L-tyr)_2(4,4'-bipy)(NO_3)_2(H_2O)_2]_n$ , (II), which contains Cu<sup>II</sup> ions, L-tyrosinate (L-tyr) and 4,4'-bipyridine (4,4'-bipy) ligands in a 2:2:1 ratio (Zhang & Hu, 2009). Herein, we present the title compound, (I), a one-dimensional Zn(II) complex with a 1:1:2 ratio of the metal ion and organic ligands.

In (I), the Zn<sup>II</sup> atom is six-coordinated by two O atoms and one N atom from two L-tyr ligands, two N atoms from two 4,4'-bipy ligands and one water molecule in a distorted octahedral geometry (Fig. 1). The L-tyr ligand bridges adjacent Zn atoms through the carboxylate group, forming a cationic chiral  $[Zn(L-tyr)(4,4'-bipy)_2(H_2O)]_n$  chain extending along [0 1 0]. The separation between the Zn atoms in the chain is 5.441 (1) Å. The hydroxyl O atom of the phenol group is uncoordinated. The L-tyr ligand binds to the Zn atoms in a  $\mu-(\kappa^3N,O:O')$  mode, the same as that observed in (II). However, the 4,4'-bipy ligand adopts a monodentate terminal mode, different from the bridging mode in (II), which leads to a one-dimensional comb-like structure (Fig. 2) rather than a layer structure as shown in (II). Therefore, in the mixed-ligand system, the L-tyr ligand provides a chiral source, while the binding mode of the 4,4'-bipy ligand is an important factor affecting structural architectures. N—H···N, O—H···N and O—H···O hydrogen bonds (Table 1) link the cationic chains, nitrate anions and uncoordinated water molecules into a supramolecular network. Intrachain  $\pi-\pi$  interactions between the pyridine rings,  $Cg1 \cdots Cg2^i = 3.615$  (4) Å, and interchain  $\pi-\pi$  interactions between the pyridine and benzene rings,  $Cg2 \cdots Cg3^{ii} = 3.636$  (4) Å, stabilize the structure [ $Cg1$ ,  $Cg2$  and  $Cg3$  are the centroids of the N3/C15—C19, N5/C25—C29 and C4—C9 rings. Symmetry codes: (i) 2 -  $x$ , -1/2 +  $y$ , - $z$ ; (ii) 1 +  $x$ ,  $y$ , 1 +  $z$ ].

**Experimental**

Zn(NO<sub>3</sub>)<sub>2</sub>·6H<sub>2</sub>O (0.119 g, 0.4 mmol) and L-tyrosine (0.072 g, 0.4 mmol) were dissolved in hot water (25 ml) under stirring. To this solution 4,4'-bipyridine (0.062 g, 0.4 mmol) in methanol (10 ml) was added. The resulting solution was allowed to stand at room temperature and yellow crystals suitable for X-ray diffraction analysis were obtained after two weeks.

**Refinement**

H atoms bonded to O atoms were located in a difference Fourier map and refined as riding atoms, with  $U_{iso}(H) = 1.5U_{eq}(O)$ . Other H atoms were positioned geometrically and refined as riding atoms, with C—H = 0.93 (aromatic), 0.97 (CH<sub>2</sub>) and 0.98 (CH) Å and N—H = 0.90 Å and with  $U_{iso}(H) = 1.2U_{eq}(C, N)$ .
