Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.006\text{ \AA}$; R factor = 0.026; wR factor = 0.067; data-to-parameter ratio = 13.5.

In the structure of the title compound, $\text{K}^+\cdot\text{C}_6\text{H}_4\text{BrClNO}_2\text{S}^- \cdot 1.5\text{H}_2\text{O}$, the K^+ ion is heptacoordinated by three O atoms from water molecules and by four sulfonyl O atoms of *N*-bromo-2-chlorobenzenesulfonamidate anions. The S–N distance of 1.582 (4) Å is consistent with an S=N double bond. The crystal structure is stabilized by intermolecular O–H···Br and O–H···N hydrogen bonds. The asymmetric unit consists of one potassium cation, one *N*-bromo-2-chlorobenzene-sulfonamidate anion and one water molecule in general positions and one water molecule located on a twofold rotation axis.

Potassium *N*-bromo-2-chlorobenzenesulfonamide sesquihydrate

B. T. Gowda, S. Foro and K. Shakuntala

Comment

To explore the effect of replacing sodium by potassium on the solid state structures of *N*-haloarylsulfonamides (Gowda *et al.*, 2011*a,b*), the structure of potassium *N*-bromo-2-chloro-benzenesulfonamide sesquihydrate (I) has been determined (Fig. 1). The structure of I resembles those of sodium *N*-bromo-2-chloro-benzenesulfonamide sesquihydrate (II) (Gowda *et al.*, 2011*b*), sodium *N*-chloro-2-chloro- benzenesulfonamide sesquihydrate (III)(Gowda *et al.*, 2010), potassium *N*-chloro-4-chloro-benzenesulfonamide monohydrate (IV)(Gowda *et al.*, 2011*a*), and other sodium *N*-chloro- arylsulfonamides (George *et al.*, 2000; Olmstead & Power, 1986).

In the structure of the title compound the K^+ ion is hepta coordinated by three O atoms from water molecules and by four sulfonyl O atoms of *N*-bromo-2-chloro-benzenesulfonamide anions. The replacement of Na^+ by K^+ changes the coordination from hexa to hepta coordination (Gowda *et al.*, 2011*b*).

The S—N distance of 1.582 (4) Å is consistent with an S—N double bond and is in agreement with the observed values of 1.579 (6) Å in (II), 1.588 (2) Å in (III) and 1.588 (2) Å in (IV)

In the crystal structure two-dimensional polymeric layer are found that are located parallel to the *ac* plane (Fig. 2). The molecular packing is stabilized by O3—H31···N1, O3—H32···Br1 and O4—H41···N1 hydrogen bonds (Table 1).

Experimental

The title compound was prepared according to the literature method (Usha & Gowda, 2006). The purity of the compound was checked by determining its melting point (176 °). It was characterized by recording its infrared and NMR spectra. Yellow prisms of the title compound used in X-ray diffraction studies were obtained from its aqueous solution at room temperature.

Refinement

The H atoms bound to O atoms were located in difference map and later restrained to O—H = 0.82 (2) Å. The other H atoms were positioned with idealized geometry using a riding model with C—H = 0.93 Å. All H atoms were refined with isotropic displacement parameters (set to 1.2 times of the U_{eq} of the parent atom).

The absolute structure was determined on the basis of 671 Friedel pairs pairs.

supplementary materials

Figures

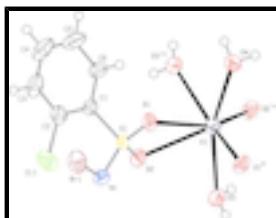

Fig. 1. Molecular structure of the title compound, showing the atom labelling scheme for the asymmetric unit and extended to show the coordination geometry for the K^+ . The displacement ellipsoids are drawn at the 50% probability level. The H atoms are represented as small spheres of arbitrary radii. Symmetry codes: (i) $x + 1/2, y, z - 1/2$; (ii) $-x + 1/2, -y, z - 1/2$.

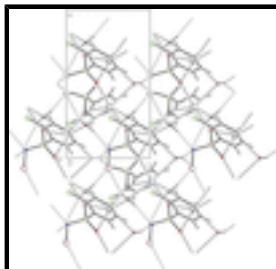

Fig. 2. Molecular packing of the title compound with hydrogen bonding shown as dashed lines.

Data collection

Oxford Diffraction Xcalibur diffractometer with a Sapphire CCD detector	1909 independent reflections
Radiation source: fine-focus sealed tube graphite	1841 reflections with $I > 2\sigma(I)$
Rotation method data acquisition using ω scans.	$R_{\text{int}} = 0.026$
Absorption correction: multi-scan (<i>CrysAlis RED</i> ; Oxford Diffraction, 2009)	$\theta_{\text{max}} = 26.4^\circ, \theta_{\text{min}} = 3.1^\circ$
$T_{\text{min}} = 0.244, T_{\text{max}} = 0.468$	$h = -8 \rightarrow 15$
4075 measured reflections	$k = -56 \rightarrow 64$
	$l = -8 \rightarrow 6$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
---------------------	--

Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.026$	H atoms treated by a mixture of independent and constrained refinement
$wR(F^2) = 0.067$	$w = 1/[\sigma^2(F_o^2) + (0.0419P)^2 + 7.9401P]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.06$	$(\Delta/\sigma)_{\max} = 0.002$
1909 reflections	$\Delta\rho_{\max} = 0.42 \text{ e \AA}^{-3}$
141 parameters	$\Delta\rho_{\min} = -0.52 \text{ e \AA}^{-3}$
4 restraints	Absolute structure: Flack (1983), 671 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: 0.019 (9)

Special details

Experimental. CrysAlis RED (Oxford Diffraction, 2009) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
