Received 30 May 2011; accepted 23 June 2011

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(C-C) = 0.004$ Å; R factor = 0.034; wR factor = 0.080; data-to-parameter ratio = 10.7.

In the title compound, $[Fe(C_5H_3N_2O_4)_2(H_2O)_2]$, the Fe^{II} ion lies on an inversion centre and is coordinated by two N and two O atoms from two 5-carboxy-1*H*-imidazole-4-carboxylate ligands and two water molecules in a distorted octahedral geometry. An intramolecular $O-H\cdots O$ hydrogen bond occurs. In the crystal, intermolecular $N-H\cdots O$ and $O-H\cdots O$ hydrogen bonds form a three-dimensional network, which consolidates the packing.

Diaquabis(5-carboxy-1*H*-imidazole-4-carboxylato- κ^2N^3,O^4)iron(II)

C.-J. Du, X.-H. Song, L.-S. Wang and C.-L. Du

Comment

In recent years, the construction of metal complexes based on 1*H*-imidazole-4,5-dicarboxylic acid ligand has been investigated in terms of their intriguing topologies. The diversity of coordination architecture of metal 4,5-dicarboxyimidazole has been described by Shimizu *et al.* (2004) and Fang *et al.* (2006). In order to search for new metal complexes based on 1*H*-imidazole-4,5-dicarboxylic acid ligand, the title complex (I) has been synthesized and its crystal determined.

The crystal structure of (I) is isostructural with the previously reported Zn (Ma *et al.*, 2003), Mg (Zhang *et al.*, 2004) and Cd (Liu *et al.*, 2004) 4,5-dicarboxyimidazole complexes. In the four isostructural complexes, all metal ions lie on an inversion centre being coordinated by two *N,O*-bidentate 1*H*-imidazole-4,5-dicarboxylate monoanionic ligands and two water molecules in a distorted octahedral geometry.

In the crystal structure of (I), intermolecular N—H···O and O—H···O hydrogen bonds (Table 1) form three-dimensional hydrogen-bonding network, which consolidate the crystal packing.

Experimental

A mixture of FeSO₄·7H₂O (0.10 mmol), 1*H*-imidazole-4,5-dicarboxylic acid (0.10 mmol), Et₃N (0.1 ml), EtOH (2 ml) and H₂O (2 ml) was sealed in a 10 ml Tefon-lined stainless-steel reactor and then heated to 393 K for 48 h under autogenous pressure, and then slowly cooled to room temperature at a rate of 5 K/h. Pale-yellow block crystals of the title complex were isolated, washed with distilled water, and dried in air (yield: 48%).

Refinement

H atoms attached to C and N atoms were placed in calculated positions (C—H = 0.93 Å, N—H = 0.86 Å) and refined as riding atoms and with $U_{\text{iso}}(\text{H}) = 1.2 U_{\text{eq}}(\text{C}, \text{N})$, respectively. The carboxy and water H atoms were located in a difference map, but placed in idealized positions (O—H = 0.82, 0.85 Å), and refined as riding with $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{O})$.

Figures

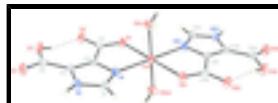

Fig. 1. The molecular structure of (I), with displacement ellipsoids drawn at the 40% probability level [symmetry code: (A) 2 - x , 2 - y , 1 - z].

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.034$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.080$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0375P)^2 + 0.0621P]$
1240 reflections	where $P = (F_o^2 + 2F_c^2)/3$
116 parameters	$(\Delta/\sigma)_{\text{max}} < 0.001$
0 restraints	$\Delta\rho_{\text{max}} = 0.25 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.25 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
