Received 10 June 2011; accepted 22 June 2011

Key indicators: single-crystal X-ray study; $T = 293\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$; R factor = 0.040; wR factor = 0.122; data-to-parameter ratio = 11.6.

The asymmetric unit of the title compound, $[\text{Li}_3(\text{C}_6\text{H}_5\text{N}_2\text{O}_2)_2(\text{NO}_3)(\text{H}_2\text{O})_2]$, contains three Li^+ ions, two ligand anions, two water molecules and a nitrate anion. Related by a centre of inversion, they form a centrosymmetric molecular cluster in which one of the Li^+ ions shows trigonal-bipyramidal and the other two distorted tetrahedral coordination. Li^+ ions are bridged by water O atoms and carboxylate O atoms donated by one of the ligands. The clusters, bridged by two nitrate O atoms, form molecular columns along [010], which are held together by $\text{O}-\text{H}\cdots\text{O}$ and $\text{O}-\text{H}\cdots\text{N}$ hydrogen bonds and $\pi-\pi$ interactions [centroid-centroid distances = 3.694 (1) and 3.796 (1) \AA].

W. Starosta and J. Leciejewicz

Comment

The asymmetric unit of the title compound contains three Li^{I} ions, two 5-methylpyrazine-2-carboxylate anions, two water molecules and a nitrate anion (Fig. 1). The coordination environment of the Li1 ion is composed of N11 , O11^{i} , O1 , O4 and O11 atoms. The latter three form a base of a distorted trigonal bipyramidal, $\text{N11},\text{O11}^{\text{i}}$ atoms are at its apices. Li1 ion is 0.0097 (2) Å out of the basal plane. The Li2 ion is coordinated by water O4 , O5 , carboxylate O12^{i} and nitrate O2^{iii} atoms which form a distorted tetrahedral coordination environment. The same distorted tetrahedral coordination geometry shows the Li3 ion surrounded by N31 , O31 , O1 and O5 atoms. The observed $\text{Li}-\text{O}$ and $\text{Li}-\text{N}$ bond distances (Table 1) are typical of Li complexes with azine carboxylate ligands. Both methylpyrazine rings are planar with r.m.s. of 0.0074 (1) Å for ring 1 and 0.0069 (1) Å for ring 3; carboxylate groups C17/O11/O12 and C37/O31/O32 make with relevant rings dihedral angles of 11.2 (1)°, and 11.0(1)°, respectively. The nitrate anion is planar [r.m.s. 0.0002 (1) Å]. Its O1 atom acts as bidentate and bridges Li1 and Li3 ions, while the O2 atom chelates the Li2 ion. Nitrate O3 atom is not coordinated at all. Li1 and Li1^{i} ions bridged by bidentate carboxylate O11 and O11^{i} form a core of a centrosymmetric cluster composed of Li1 and Li3 ions bridged by bidentate nitrate O1 atom, Li1 and Li2 bridged by the aqua O4 atom, Li2 and Li3 bridged by the aqua O5 atom. The clusters bridged via nitrate O1 and O2 atoms, form molecular columns along the direction [010] and they are held together by a network of hydrogen bonds in which aqua O4 and O5 molecules are as donors and carboxylate O31 and O32 atoms are acceptors. $\pi-\pi$ interactions between methylpyrazine rings of adjacent columns are defined: the centres of gravity of the ring ($\text{N11}, \text{C12}, \text{C13}, \text{N12}, \text{C15}, \text{C16}$) and its symmetry generated heterocyclic rings [$2-x, -1/2+y, 5/2-z; 2-x, 1/2+y, 5/2-z$] both are separated by 3.694 (1) Å, and the ring ($\text{N31}, \text{C32}, \text{C33}, \text{N32}, \text{C35}, \text{C36}$) operated by symmetry [$1-x, -1/2+y, 3/2-z; 1-x, 1/2+y, 3/2-z$] generates two equal stacking contacts of 3.796 (1) Å (Fig. 2). However, their shifts are about 3.5 Å. Molecular columns composed of centrosymmetric dimers have been also observed in the structure of a Li^{I} complex with 3-aminopyrazine-2-carboxylate and water ligands (Starosta & Leciejewicz, 2010). Molecular layers built of centrosymmetric dimers have been reported in the structure of a complex with pyridazine-4-carboxylate and water ligands (Starosta & Leciejewicz, 2011a) while centrosymmetric molecular ribbons bridged by nitrate ions form double-layers in the structure of a complex with pyrimidine-2-carboxylate and nitrate ligands (Starosta & Leciejewicz, 2011b). On the other hand, monomeric molecules, in which a Li^{I} ion is chelated by ligand N,O bonding group and two aqua O atoms constitute the structure of a complex with pyridazine-3-carboxylate and water ligands (Starosta & Leciejewicz, 2011a).

Experimental

Hot aqueous solutions, one containing 1 mmol of 5-methylpyrazine-2-carboxylic acid (Aldrich), the other 1 mmol of lithium (I) nitrate were mixed and boiled under reflux with constant stirring for 5 h. Left for evaporation at room temperature. After a couple of days yellow single-crystal plates of the title complex deposited on the bottom of a crystallization pot. Crystals were washed with cold ethanol and dried in air.

supplementary materials

Refinement

Pyrazine ring H atoms were placed in calculated positions with C—H = 0.93 and 0.96 Å and treated as riding on the parent atoms with $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{C})$ or $U_{\text{iso}}(\text{H})=1.5U_{\text{eq}}(\text{C}_{\text{methyl}})$. Water H atoms were found in Fourier map and refined isotropically.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.040$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.122$	H atoms treated by a mixture of independent and constrained refinement
$S = 1.07$	$w = 1/[\sigma^2(F_o^2) + (0.0709P)^2 + 0.484P]$ where $P = (F_o^2 + 2F_c^2)/3$
3215 reflections	$(\Delta/\sigma)_{\max} = 0.001$
277 parameters	$\Delta\rho_{\max} = 0.35 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.31 \text{ e \AA}^{-3}$

Special details

Experimental. (CrysAlis PRO; Oxford Diffraction Ltd., Version 1.171.33.66 (release 28-04-2010 CrysAlis171 .NET) (compiled Apr 28 2010,14:27:37) Empirical absorption correction using spherical harmonics, implemented in SCALE3 ABSPACK scaling algorithm.

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.

O11—Li1—O1—N1	−29.2 (2)	C16—C15—N12—C13	1.5 (2)
O4—Li1—O1—N1	151.67 (11)	C18—C15—N12—C13	−178.41 (16)
N11—Li1—O1—N1	62.14 (16)	C12—C13—N12—C15	−1.7 (2)
Li1 ⁱ —Li1—O1—N1	−78.4 (2)		

Symmetry codes: (i) $-x+2, -y, -z+2$; (ii) $x, y-1, z$; (iii) $x, y+1, z$.

Hydrogen-bond geometry (Å, °)

$D—H\cdots A$	$D—H$	$H\cdots A$	$D\cdots A$	$D—H\cdots A$
O4—H41 ^{iv} —O32 ^{iv}	0.85 (2)	1.92 (2)	2.7449 (15)	165.3 (19)
O4—H42 ^v —N12 ^v	0.85 (2)	2.03 (2)	2.8414 (17)	159.0 (19)
O5—H52 ^{vi} —N32 ^{vi}	0.84 (2)	2.05 (2)	2.8550 (17)	162 (2)
O5—H51 ^{iv} —O31 ^{iv}	0.86 (2)	1.85 (2)	2.7055 (15)	172 (2)

Symmetry codes: (iv) $-x+1, -y, -z+2$; (v) $-x+2, y-1/2, -z+5/2$; (vi) $-x+1, y-1/2, -z+3/2$.
