Received 23 June 2011; accepted 26 June 2011

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.041; wR factor = 0.101; data-to-parameter ratio = 15.8.

The title mononuclear cobalt(III) complex, $[\text{Co}(\text{C}_{14}\text{H}_{19}\text{N}_2\text{O}_2)(\text{C}_8\text{H}_7\text{O}_2)(\text{NCS})]$, was obtained by the reaction of 2-acetylphenol, 2-(morpholin-4-yl)ethylamine, ammonium thiocyanate and cobalt nitrate in methanol. The Co^{III} atom is coordinated by one phenolate O, one imine N, and one amine N atom of the tridentate Schiff base ligand, two O atoms of the 2-acetylphenolato anion and one thiocyanate N atom. This results in a fairly regular *fac*- CoN_3O_3 octahedral coordination geometry for the metal ion. The dihedral angle between the two benzene rings is $88.3(3)^\circ$.

(2-Acetylphenolato)(2-{1-[2-(morpholin-4-yl)ethylimino]ethyl}phenolato)(thiocyanato- κN)cobalt(III)

C.-Y. Wang

Comment

As part of our investigations into urease inhibitors (Wang & Ye, 2011; Wang, 2009), we have synthesized the title compound, a new mononuclear cobalt(III) complex, Fig. 1. The Co atom in the complex is six-coordinated by one phenolate O, one imine N, and one amine N atoms of a Schiff base ligand 2-[1-(2-morpholin-4-ylethylimino)ethyl]phenolate, two O atoms of 2-acetylphenolate, and one thiocyanate N atom, forming an octahedral geometry. The dihedral angle between the two benzene rings are 88.3 (3) $^{\circ}$. The three *trans* angles at Co atom are in the range 175.1 (1)–177.5 (1) $^{\circ}$; the other angles are close to 90 $^{\circ}$, ranging from 84.4 (1) to 94.2 (1) $^{\circ}$ (Table 1), indicating a slightly distorted octahedral coordination. The Co–O and Co–N bond lengths (Table 1) are typical and are comparable with those observed in other similar cobalt(III) complexes (Li *et al.*, 2007; Liu, 2010; Li *et al.*, 2008; Wu *et al.*, 2011).

Experimental

2-Acetylphenol (1.0 mmol, 0.136 g), 2-morpholin-4-ylethylamine (0.5 mmol, 0.065 g), ammonium thiocyanate (1.0 mmol, 0.076 g), and cobalt nitrate hexahydrate (0.5 mmol, 0.145 g) were dissolved in MeOH (30 ml). The mixture was stirred at room temperature for 10 min to give a clear deep brown solution. After keeping the solution in air for a week, brown block-shaped crystals were formed at the bottom of the vessel.

Refinement

All H atoms were placed in geometrically idealized positions and constrained to ride on their parent atoms, with C—H distances in the range 0.93–0.97 Å, and with $U_{\text{iso}}(\text{H})$ set at 1.2 $U_{\text{eq}}(\text{C})$ and 1.5 $U_{\text{eq}}(\text{methyl C})$.

Figures

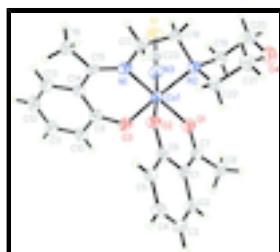

Fig. 1. The molecular structure of the title compound, showing displacement ellipsoids drawn at the 30% probability level.

Data collection

Bruker SMART CCD diffractometer	4588 independent reflections
Radiation source: fine-focus sealed tube	2764 reflections with $I > 2\sigma(I)$
graphite	$R_{\text{int}} = 0.047$
ω scans	$\theta_{\text{max}} = 26.5^\circ, \theta_{\text{min}} = 2.6^\circ$
Absorption correction: multi-scan (<i>SADABS</i> ; Sheldrick, 1996)	$h = -10 \rightarrow 9$
$T_{\text{min}} = 0.761, T_{\text{max}} = 0.786$	$k = -15 \rightarrow 19$
13159 measured reflections	$l = -21 \rightarrow 22$

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.041$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.101$	H-atom parameters constrained
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0387P)^2 + 0.1364P]$ where $P = (F_o^2 + 2F_c^2)/3$
4588 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
291 parameters	$\Delta\rho_{\text{max}} = 0.24 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.22 \text{ e \AA}^{-3}$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
