Received 2 June 2011; accepted 3 June 2011

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$; R factor = 0.068; wR factor = 0.139; data-to-parameter ratio = 11.2.

The asymmetric unit of the title compound, $\text{C}_6\text{H}_5\text{N}_5\text{C}_9\text{H}_6\text{O}_6$, comprises a full molecule each of neutral trimesic acid (tma) and zwitterionic 5-(pyridin-1-i um-3-yl)-5H-1,2,3,4-tetrazol-5-ide (ptz). The components are linked into a two-dimensional layer by a combination of $\text{O}-\text{H}\cdots\text{O}$, $\text{O}-\text{H}\cdots\text{N}$, $\text{N}-\text{H}\cdots\text{O}$ and $\text{N}-\text{H}\cdots\text{N}$ hydrogen bonds parallel to the $(10\bar{1})$ plane. Layers comprising alternating rows of tma and ptz are linked into a three-dimensional network by $\text{C}-\text{H}\cdots\text{O}$ and $\pi-\pi$ interactions between tma and tetrazolate rings [centroid-centroid distance = $3.763(2)\text{ \AA}$], and between pyridinium and tetrazolate rings [centroid-centroid distance = $3.745(2)\text{ \AA}$].

Benzene-1,3,5-tricarboxylic acid-5-(pyridin-1-ium-3-yl)-5*H*-1,2,3,4-tetrazol-5-ide (I/1)

G.-X. Meng, H. Ding, Y.-M. Feng, J.-H. Zhu and H.-L. Yang

Comment

Recently, pyridyl-tetrazole ligands have been used in the construction of metal-organic complexes (Yang, *et al.*, 2011; Lin *et al.*, 2005; Luo, *et al.*, 2005). In the reaction of trimesic acid (tma), 5-(3-pyridyl)tetrazolate (ptz) and CdSO₄ under hydrothermal conditions, we have unexpectedly obtained the title compound, (I), and determined its crystal structure.

In (I), the asymmetric unit comprises a neutral trimesic acid (tma) molecule and a 5-(3-pyridinium)tetrazolate (ptz) zwitterion (Fig. 1). In tma, the three carboxyl hydrogen atoms were readily found from the difference maps. This, coupled with the disparity in the C—O bond distances, confirms its neutral composition. The three carboxyl groups are twisted away from the central benzene plane forming dihedral angles of 6.59 (17) °, 16.12 (16) ° and 7.10 (16) ° between the groups containing the O1, O3 and O5 atoms, respectively. In the ptz zwitterion, the tetrazole ring is twisted away from the adjacent benzene ring with the dihedral angle between them being 16.38 (16) °.

In the crystal packing of (I), the component species are linked into a two-dimensional array running parallel to the (10 $\overline{1}$) plane by a combination of O—H···O, O—H···N, N—H···O and N—H···N hydrogen bonds (Fig. 2 and Table 2). The layer can be analysed in terms of two sub-structures. Firstly, by the O1—H1A···O5 ($x, y - 1, z$) and N—H1···N4 ($x, 1 + y, z$) hydrogen bonds which link tma and 3-ptz ions into one-dimensional chains along the *c* axis (Fig. 2). Secondly, adjacent chains are joined together by the N1—H1···O3, O4—H4A···N3 ($x, 1 + y, z$) and O6—H6A···N5 ($1 + x, 1 + y, 1 + z$) hydrogen bonds, resulting in the formation of a two-dimensional layer parallel to the (10 $\overline{1}$) plane (Fig. 2). Further analysis indicates that these adjacent layers are linked into the three-dimensional network by a combination of a C4—H4···O2 ($-x, 1 - y, 1 - z$) contacts and two π – π interactions (Fig. 3), one occurs between symmetry-related tma and tetrazolate rings [centroid distance: 3.763 (2) Å, dihedral angle: 11.10 (15) °, symmetry code: $1 - x, 1 - y, 1 - z$], and the other occurs between symmetry-related pyridinium and tetrazolate rings [centroid distance: 3.745 (2) Å, dihedral angle: 16.38 (16) °, symmetry code: $-x, 1 - y, 1 - z$].

Experimental

All the reagents and solvents were used as obtained without further purification. Equivalent molar amounts of trimesic acid, 5-(3-pyridyl)tetrazole and CdSO₄ were reacted under hydrothermal conditions. The mixture was sealed in a 23 cm³ Teflon-lined stainless steel container. The temperature was kept at 433 K for 4 days and cooled to room temperature at the rate of 5 K/h. Colourless crystals of (I) were obtained and separated manually.

Refinement

H atoms bonded to C atoms were positioned geometrically with C—H = 0.93 Å and refined in a riding mode with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. H atoms bonded to O and N were found in difference maps. Their positions were refined freely (see Table 1) with $U_{\text{iso}}(\text{H}) = 1.2$ (N) or 1.5 (O) times U_{eq} (parent atom).

supplementary materials

Figures

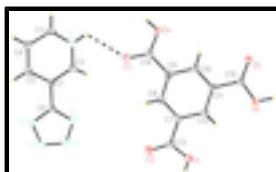

Fig. 1. The molecular structures of the constituents of (I), showing the atom-numbering scheme. Displacement ellipsoids are drawn at the 50% probability level and H atoms are shown as small spheres of arbitrary radii. The hydrogen bond is shown as a dashed line.

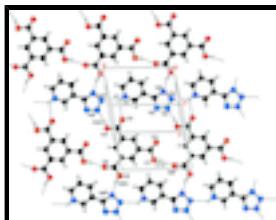

Fig. 2. Part of the crystal structure of (I), showing the formation of the two-dimensional layer parallel to the (101) plane stabilised by a combination of O—H···O, O—H···N, N—H···O and N—H···N hydrogen bonds. Symmetry codes: i) $x, 1 + y, z$; ii) $x, y - 1, z$; iii) $1 + x, 1 + y, 1 + z$.

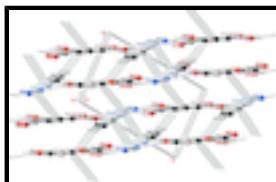

Fig. 3. Part of the crystal structure of (I), showing the formation of the three-dimensional network by a combination of hydrogen bonds (see Fig. 2), C—H···O and π — π interactions (dashed lines). Hydrogen atoms not involved in significant intermolecular contacts have been omitted for clarity.

0 restraints	Extinction correction: <i>SHELXL97</i> (Sheldrick, 2008), $F_c^* = kF_c[1 + 0.001xF_c^2\lambda^3/\sin(2\theta)]^{1/4}$
Primary atom site location: structure-invariant direct methods	Extinction coefficient: 0

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
