Received 28 April 2011; accepted 20 May 2011

Key indicators: single-crystal X-ray study;  $T = 293\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.008\text{ \AA}$ ;  $R$  factor = 0.067;  $wR$  factor = 0.168; data-to-parameter ratio = 14.9.

There are two independent molecules in the asymmetric unit of the title compound,  $C_{13}H_9Cl_2NO$ , in which the dihedral angles between the phenyl and dichlorophenyl rings have significantly different values [48.5 (3) and 65.1 (3) $^\circ$ ]. In the crystal, the molecules are linked *via* intermolecular N—H $\cdots$ O hydrogen bonds into chains running parallel to the  $c$  axis.

## 2,6-Dichloro-N-phenylbenzamide

H. Liu, N. Xu, B. Yang, W. Wang and P. Han

### Comment

In the title compound (Fig. 1), the bond lengths and angles are within normal ranges (Allen *et al.*, 1987). There are two independent molecules in an asymmetric unit. The dihedral angle between phenyl (C1–C6) and dichlorophenyl (C8–C13) rings in one molecule is 48.5 (3)° compared to 65.1 (3)° in the other molecule. In the crystal structure, intermolecular N—H···O hydrogen bonds (Table 1) link the molecules into chains running parallel to the *c*-axis (Fig. 2). The structure is further stabilized by intramolecular interactions of the type C—H···O (Table 1).

### Experimental

The title compound was prepared by following a reported procedure (Houlihan *et al.*, 1981). A mixture of aniline (2.8 g, 0.03 mol), 2,6-dichlorobenzoyl chloride (6.3 g, 0.03 mol), and 6 ml triethylamine in 50 ml anhydrous tetrahydrofuran was stirred and refluxed for 8 h and then allowed to stand at room temperature. The resulting solid was filtered off and washed with water ( $2 \times 30$  ml), dried over sodium sulfate (yield: 7.2 g, 90%). The title compound was purified by crystallizing from ethanol yielding crystals suitable for X-ray diffraction analysis.

### Refinement

H atoms were positioned geometrically, with C—H = 0.93 and N—H = 0.86 Å and constrained to ride on their parent atoms, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C}/\text{N})$ .

### Figures

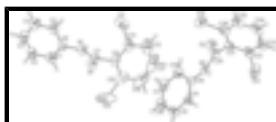

Fig. 1. The molecular structure of the title compound showing the atom-numbering scheme and displacement ellipsoids at the 30% probability level.

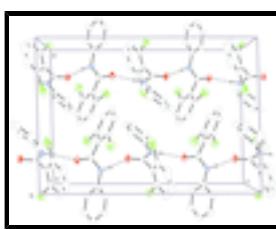

Fig. 2. A packing diagram of the title compound. The intermolecular hydrogen bonds are shown as dashed lines; H-atoms not involved in H-bonding have been excluded for clarity.

## Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.067$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.168$	H-atom parameters constrained
$S = 1.00$	$w = 1/[\sigma^2(F_o^2) + (0.070P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
4586 reflections	$(\Delta/\sigma)_{\text{max}} < 0.001$
307 parameters	$\Delta\rho_{\text{max}} = 0.24 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.36 \text{ e \AA}^{-3}$

## Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
