Received 5 June 2011; accepted 29 June 2011

Key indicators: single-crystal X-ray study; $T = 298$ K; mean $\sigma(\text{C}-\text{C}) = 0.008$ Å; R factor = 0.032; wR factor = 0.073; data-to-parameter ratio = 15.5.

In the title compound, $[\text{Sn}(\text{CH}_3)_3(\text{C}_7\text{H}_3\text{F}_2\text{O}_2)]_n$, the central Sn atom is coordinated by two O atoms from the anion and three methyl C atoms in a polymeric fashion owing to the presence of bidentate bridging carboxylate ligands. The five-coordinate Sn atom exists in a distorted trigonal-bipyramidal geometry with the molecules connected by weak C—H···F intermolecular interactions, forming supramolecular chains parallel to [010].

Comment

In recent years, organotin compounds have attracted increasing attention owing to their wide industrial applications and biological activities (Duboy and Roy, 2003). In continuation of our work in this area, we present the crystal structure of a new compound, (I), $C_{10}H_{12}F_2O_2Sn$. Similar structures for related trimethyl carboxylates have been reported. (Tiekink, 1994).

In the title compound, (I), the central Sn atom is coordinated by two oxygen atoms from the ligand and three carbon methyl atoms in a polymeric fashion owing to the presence of bidentate bridging carboxylate ligands (Fig. 1). The $Sn(1)—O(1)$ and $Sn(1)—O(2)\#1$ ($\#1 = -x + 1/2, y - 1/2, -z + 1/2$) distances are $2.137(3)\text{\AA}$ and $2.540(4)\text{\AA}$, respectively. The angle of the axial $O(1)—Sn(1)—O(2)\#1$ is $175.92(13)^\circ$, which deviates slightly from linearity. The five-coordinate Sn atom exists in a distorted trigonal bipyramidal geometry with the molecules connected by weak C—H \cdots F intermolecular interactions, forming one-dimensional supramolecular chains along the (101) plane (Fig. 2).

Experimental

3,5-difluorobenzoic acid (0.4 mmol) was added to a methanol solution of sodium ethoxide (0.4 mmol) and heated at reflux for 0.5 h. To this solution was added trimethyltin chloride (0.8 mmol) in benzene and the mixture was refluxed for 8 h, cooled and filtered. The filtrate was evaporated *in vacuo*. The obtained solid was recrystallized from dichloromethane-petroleum ether. Anal. Calcd (%) for $C_{10}H_{12}F_2O_2Sn$ ($M_r = 320.89$): C, 37.43; H, 3.77; Found (%): C, 38.21; H, 3.92.

Refinement

The H atoms were positioned geometrically and refined using the riding model with C—H = 0.93\AA , for aromatic H, 0.96\AA for methyl H atoms. The U_{iso} parameters for H atoms were constrained to be $1.5U_{eq}$ of the carrier atom for the methyl H atoms and $1.2U_{eq}$ of the carrier atom for the remaining H atoms

Figures

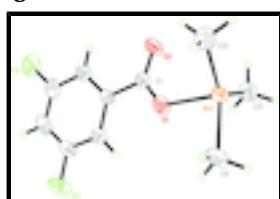

Fig. 1. *ORTEP* diagram of the title compound, with 50% probability displacement ellipsoids.

supplementary materials

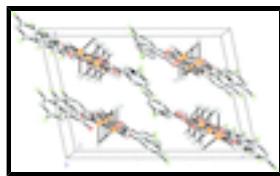

Fig. 2. The crystal packing of the title compound, viewed along the b axis. H atoms have been omitted for clarity.
