Key indicators: single-crystal X-ray study; $T = 100$ K; mean $\sigma(C-C) = 0.007 \text{ \AA}$; disorder in solvent or counterion; R factor = 0.059; wR factor = 0.148; data-to-parameter ratio = 16.4.

The title compound $[\text{Mn}_6(\text{C}_7\text{H}_4\text{NO}_3)_5(\text{CH}_3\text{CO}_2)_2(\text{C}_5\text{H}_8\text{N}_2)_4 \cdot (\text{C}_3\text{H}_7\text{NO})_2 \cdot (\text{C}_2\text{H}_5)_2\text{O} \cdot \text{C}_3\text{H}_7\text{NO} \cdot \text{CH}_3\text{OH} \cdot 0.12\text{H}_2\text{O}$, abbreviated as $\text{Mn}^{\text{II}}(\text{OAc})_2[15-\text{MC}_{\text{MnIII}(\text{N})\text{shi}-5}](\text{EtIm})4(\text{DMF})2 \cdot \text{diethyl ether} \cdot \text{DMF} \cdot \text{MeOH} \cdot 0.12\text{H}_2\text{O}$ (where ${}^-\text{OAc}$ is acetate, MC is metallacrown, shi³⁻ is salicylhydroximate, EtIM is *n*-ethylimidazole, DMF is *N,N*-dimethylformamide, and MeOH is methanol) contains five Mn^{III} ions as members of the metallacrown ring and an Mn^{II} ion bound in the central cavity. The central Mn^{II} ion is seven-coordinate with a distorted face-capped trigonal-prismatic geometry. The five Mn^{III} ions of the metallacrown ring are six-coordinate with distorted octahedral geometries. The configuration of the Mn^{III} ions about the metallacrown ring follow a $\Delta\Delta\Delta PP$ pattern, with *P* representing planar. The four 1-ethylimidazole ligands are bound to four different Mn^{III} ions. A diethyl ether solvent molecule was found to be disordered over two mutually exclusive sites with an occupancy ratio of 0.568 (7):0.432 (7). A methanol solvent molecule was found to be disordered over two mutually exclusive sites by being hydrogen bonded either to a dimethylformamide solvent molecule (major occupancy component) or to an O atom of the main molecule (minor occupancy component). The occupancy ratio refined to 0.678 (11):0.322 (11). Associated with the minor component is a partially occupied water molecule [total occupancy 0.124 (15)].

Comment

Metallacrowns (MCs) are a versatile class of inorganic molecules that serve both as structural and functional analogues to crown ethers (Mezei *et al.*, 2007; Pecoraro *et al.*, 1997). In addition to mimicking crown ethers, MCs have other potential uses such as single-molecule magnets, MRI contrast agents, and catalysts (Mezei *et al.*, 2007). The naming scheme for MCs is similar to that of crown ethers. For example, 15-MC-5 indicates that the ring size of the MC consists of 15 atoms and that there are 5 oxygen atoms capable of binding a metal ion in the central cavity. A complete naming scheme can be found in the review by Pecoraro *et al.* (1997). Manganese-based 15-MC-5 structures were the first 15-MC-5 compounds reported (Kessissoglou *et al.*, 1994), and some of these molecules have shown antibacterial activity (Dendrinou-Samara *et al.*, 2002; Dendrinou-Samara *et al.*, 2005).

Herein we report the synthesis, IR data, and the single-crystal X-ray structure of the title compound, $[\text{Mn}_6(\text{C}_7\text{H}_4\text{NO}_3)_5(\text{C}_5\text{N}_2\text{H}_8)_4(\text{C}_3\text{H}_7\text{NO})_2(\text{C}_2\text{H}_3\text{O}_2)_2] \cdot (\text{C}_2\text{H}_5)_2\text{O} \cdot \text{C}_3\text{H}_7\text{NO} \cdot \text{CH}_3\text{OH} \cdot 0.12\text{H}_2\text{O}$, **1**, abbreviated as $\text{Mn}^{\text{II}}(\text{OAc})_2[15-\text{MC}_{\text{Mn}^{\text{III}}}^{\text{N(shi)}}-\text{5}](\text{EtIm})_4(\text{DMF})_2\text{-Diethyl ether-DMF-MeOH-0.12H}_2\text{O}$ (where OAc is acetate, MC is metallacrown, shi³⁻ is salicylhydroximate, EtIM is *n*-ethylimidazole, DMF is *N,N*-dimethylformamide, and MeOH is methanol). The single-crystal X-ray structure of a related molecule, $\text{Mn}^{\text{II}}(\text{OAc})_2[15-\text{MC}_{\text{Mn}^{\text{III}}}^{\text{N(shi)}}-\text{5}](\text{Im})_3(\text{EtOH})_3$ (where Im is imidazole and EtOH is ethanol), has previously been reported by Emerich *et al.* (2010).

Compound **1** is a non-planar molecule, which is typical of $\text{Mn}^{\text{II}}[15-\text{MC}_{\text{Mn}^{\text{III}}}-\text{5}]$ structures (Fig. 1–5; Farrugia, 1997). The structure consists of a $[\text{Mn}^{\text{III}}-\text{N}-\text{O}]_5$ repeat unit around the MC ring, and the MC binds a Mn^{II} in the central cavity (Fig. 1). The positive charge of the five Mn^{III} ions and the one Mn^{II} ion are counterbalanced by the five shi³⁻ ligands and two acetate anions. Mn1 is located in the central cavity and is seven-coordinate with distorted face-capped trigonal prismatic geometry (Fig. 2). The geometry assignment is based on the calculated azimuthal angle (Φ). In an ideal face-capped octahedron $\Phi = 60^\circ$, while in an ideal face-capped trigonal prism $\Phi = 0^\circ$. To calculate the Φ angle, the centers of opposite triangular faces made by the donor oxygen atoms (O1, O13, and O18; O7, O10, and O17) were defined using the program Mercury (Macrae *et al.*, 2006), and then twist angles between atoms on opposite faces through the centroids were calculated (Fig. 3). The calculated Φ angles of 9.77° , 12.78° , and 15.95° indicate the geometry approaches more that of face-capped trigonal prismatic. Another parameter that indicates the geometry is the *s/h* ratio (Stiefel and Brown, 1972). In an ideal octahedron the *s/h* ratio is 1.22, while in an ideal trigonal prism the *s/h* ratio is 1.00. Defining the distance between the centroids in Fig. 3 as *h*, the average *s/h* ratio for **1** is 1.00 ± 0.10 . Thus both the Φ angle and the *s/h* ratio support a distorted face-capped trigonal prismatic geometry. The assignment of 2+ for Mn1 is supported by an average bond distance of 2.24 \AA . The ring Mn (2–6) are assigned a 3+ oxidation state. This is supported by the average bond distance, and the observation of a Jahn-Teller axis for each ring Mn, which is typical for a high spin d^4 cation. The average bond distances for Mn2, Mn3, Mn4, Mn5, and

supplementary materials

Mn6 are 2.03 Å, 2.03 Å, 2.03 Å, 2.05 Å, and 2.09 Å, respectively. Each Mn^{III} is six-coordinate with a distorted octahedral geometry (Fig. 4). It should be noted that Mn6 has one long interaction with an acetate oxygen atom (Mn6—O18, 2.684 (3) Å) that is needed to complete the octahedral geometry. The coordination about the Mn^{III} ions can also be described by their configurations. Mn2 has a propeller configuration with Δ absolute stereochemistry. Mn3 and Mn4 do not adopt a propeller configuration, but instead two shi³⁻ ligands are *trans* to each other. Thus, Mn3 and Mn4 adopt a planar (P) configuration. Mn5 has a propeller configuration with Δ absolute stereochemistry, and Mn6 has a propeller configuration with Λ absolute stereochemistry. Starting with Mn5, the configuration pattern for the Mn^{III} ions about the MC ring is ΔΛΔPP. In addition, Mn2, Mn4, Mn5, and Mn6 bind *n*-ethylimidazole ligands, which are directed to the periphery of the molecule. Lastly, a disordered diethyl ether molecule, a disordered methanol molecule, a dimethylformamide molecule, and a partially occupied water molecule (0.124 (15)) are located in the lattice.

Experimental

Manganese(II) acetate tetrahydrate (99+%) and *N,N*-dimethylformamide (ACS grade) were purchased from Acros Organics, salicylhydroxamic acid (H₃shi, 99%) was purchased from Alfa Aesar, *n*-ethylimidazole (98%) was purchased from TCI America, methanol (HPLC grade) was purchased from Fisher Scientific, and absolute diethyl ether was purchased from EMD Chemicals. All reagents were used as received and without further purification.

The compound {Mn^{II}(OAc)₂[12-MC_{Mn^{III}}N(shi)-4](DMF)₆}.2DMF was prepared as previously reported (Lah & Pecoraro, 1989), and dark brown crystals were isolated and dried. Then 0.1 mmol of the {Mn^{II}(OAc)₂[12-MC_{Mn^{III}}N(shi)-4](DMF)₆}.2DMF compound was dissolved in 20 ml of a 50:50 mixture of methanol and DMF. The resulting mixture was a dark brown color. Then 25 μL of *n*-ethylimidazole was added to this solution, and the solution was stirred for 5 minutes. The resulting dark brown solution was filtered and no precipitate was recovered. Diffusion of diethyl ether into the filtrate at approximately 277 K (4 °C) resulted in dark brown cube-like crystals after 9 days. The percent yield was 22% based on the {Mn^{II}(OAc)₂[12-MC_{Mn^{III}}N(shi)-4](DMF)₆}.2DMF starting material. Elemental analysis for the dried material (accounting for the loss of the diethyl ether lattice solvent) C₆₉H_{83.24}Mn₆N₁₆O_{23.12} [FW = 1836.28 g/mol] found % (calculated); C 45.59 (45.13); H 4.44 (4.57); N 12.37 (12.20).

Refinement

A solvent diethyl ether molecule was found to be disordered over two mutually exclusive sites. The molecules were restrained to have similar geometries and equivalent atoms were constrained to have identical ADPs. The occupancy ratio refined to 0.568 (7) to 0.432 (7). A solvent methanol molecule was found to be disordered over two mutually exclusive sites by being hydrogen bonded either to a solvent DMF molecule (major moiety) or to an oxygen atom of the main molecule (minor moiety). The two molecules were restrained to have similar C—O distances. The occupancy ratio refined to 0.678 (11) to 0.322 (11). Associated with the minor moiety is a partially occupied water molecule (total occupancy: 0.124 (15)). This position of the water oxygen atom and of its H atoms was restrained based on hydrogen bonding considerations. It was also restrained to be approximately isotropic. The carbon atoms of one ethyl group (C48, C49) showed signs of unresolved disorder and were restrained to be approximately isotropic.

Hydrogen atoms were placed in calculated positions with C—H = 0.95 (aromatic), 0.98 (methyl) and 0.99 Å (methylene) and were refined with U_{iso}~(H) = 1.5 *U*_{eq}(C) for methyl H atoms and 1.2 *U*_{eq}(C) for methylene and aromatic moieties.

Figures

Special details

Experimental. FT-IR bands (KBr pellet, cm^{-1}): 1655(*w*), 1598(*m*), 1572(*s*), 1500(*s*), 1438(*m*), 1389(*m*), 1320(*m*), 1259(*m*), 1100(*m*), 1032(*w*), 927(*m*), 866(*m*), 755(*m*), 681(*m*), 651(*m*), 603(*m*), and 470(*m*).

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
