Received 15 June 2011; accepted 5 July 2011

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.009\text{ \AA}$; R factor = 0.047; wR factor = 0.096; data-to-parameter ratio = 25.5.

The title compound, $(\text{C}_5\text{H}_{12}\text{NO})_2[\text{ZnBr}_4]$, was synthesized by hydrothermal reaction of ZnBr_2 with 4-methylmorpholine in a HBr/distilled water solution. Each of the two independent cations exhibits a chair conformation; the anion deviates slightly from an tetrahedral configuration. The $\text{Zn}-\text{Br}$ distances in the anion are in the range of 2.3996 (9)–2.4247 (9) \AA . All of the amine H atoms are involved in bifurcated intermolecular $\text{N}-\text{H}\cdots\text{Br}$ hydrogen bonds, building up a trimer.

Bis(4-methylmorpholin-4-ium) tetrabromidozincate(II)

C. Peng and Y. Li

Comment

The amino derivatives have found wide range of applications in material science, such as magnetic, fluorescent and dielectric behaviors. And there has been an increased interest in the preparation of amino coordination compound (Aminabhavi *et al.*, 1986; Fu, *et al.* 2009). We report here the crystal structure of the title compound, Bis-(4-methylmorpholin-4-ium) tetrabromidozincate(II).

The asymmetric unit is composed of one ZnBr_4^{2-} anion and two 4-methylmorpholin-4-ium cations (Fig. 1). Both the amine N atoms were protonated, thus indicating two positive charge in all. And the ZnBr_4^{2-} anion was showing two negative charge to make the charge balance. The geometric parameters of the title compound are in the normal range.

In the crystal structure, all the H atoms of amine groups are involved in intermolecular N—H···Br hydrogen bonds building up a trimer (Table 1 and Fig. 2).

Experimental

A mixture of 4-methylmorpholine (0.4 mmol), ZnBr_2 (0.4 mmol) and HBr/distilled water (10 ml, 1:3) sealed in a Teflon-lined stainless steel vessel, was maintained at 100 °C. Colorless needle crystals suitable for X-ray analysis were obtained after 3 days.

Refinement

All H atoms attached to C atoms were fixed geometrically and treated as riding with C—H = 0.97 Å(methylene) and C—H = 0.96 Å(methyl) with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{methylene})$ and $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{methyl})$. The positional parameters of the H atoms (N1, N2) were refined freely. And in the last stage of the refinement, it were restrained with the H—N = 0.90 (2) Å, with $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{N})$.

Figures

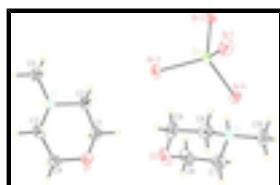

Fig. 1. Molecular view of the title compound with the atomic numbering scheme. Displacement ellipsoids are drawn at the 30% probability level.

supplementary materials

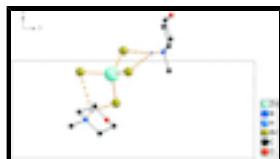

Fig. 2. The crystal packing of the title compound viewed along the c axis showing the one-dimensionnal hydrogen bondings chain (dashed line). Hydrogen atoms not involved in hydrogen bonding have been omitted for clarity.

Refinement

Refinement on F^2	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.047$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.096$	H-atom parameters constrained
$S = 1.07$	$w = 1/[\sigma^2(F_o^2) + (0.024P)^2 + 1.999P]$
4439 reflections	where $P = (F_o^2 + 2F_c^2)/3$
174 parameters	$(\Delta/\sigma)_{\text{max}} = 0.001$
0 restraints	$\Delta\rho_{\text{max}} = 0.58 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.78 \text{ e \AA}^{-3}$

Special details

Geometry. All esds (except the esd in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell esds are taken into account individually in the estimation of esds in distances, angles and torsion angles; correlations between esds in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell esds is used for estimating esds involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R-factor wR and goodness of fit S are based on F^2 , conventional R-factors R are based on F, with F set to zero for negative F^2 . The threshold expression of $F^2 > 2\text{sigma}(F^2)$ is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on F^2 are statistically about twice as large as those based on F, and R- factors based on ALL data will be even larger.
