Received 9 June 2011; accepted 18 July 2011

Key indicators: single-crystal X-ray study;  $T = 200$  K; mean  $\sigma(C-C) = 0.005$  Å; disorder in solvent or counterion;  $R$  factor = 0.045;  $wR$  factor = 0.115; data-to-parameter ratio = 17.9.

In the title cationic  $Cp^*\text{Fe}(\text{II})$  complex,  $[\text{Fe}(\text{C}_{10}\text{H}_{15})(\text{CH}_3\text{CN})-(\text{C}_{14}\text{H}_{16}\text{NP})]\text{PF}_6 \cdot \text{C}_4\text{H}_8\text{O}$ , the metal ion is coordinated by the  $\eta^5\text{-Cp}^*$  ring as well as the P and N atoms of the chelating 2-(diphenylphosphino)ethylamine ligand and an additional acetonitrile molecule in a piano-chair conformation. The  $\text{PF}_6^-$  anion is disordered over two sets of sites with occupancies of 0.779 (7) and 0.221 (7).

**Comment**

There are numerous reports on well defined  $Cp^*$ Ru(II) complexes bearing a 2-(diphenylphosphino)ethylamine ligand e.g. by Ito *et al.* (2011), Ito *et al.* (2009), Ito *et al.* (2007), Ito *et al.* (2005), Ito *et al.* (2003). Surprisingly, only a scarce number of corresponding Fe(II) complexes has been reported, e.g. by Davies *et al.* (1994) and Lagaditis *et al.* (2010), although both elements are homologues in group 8. The only reported structural analysis of an iron complex with this type of P,N-coordination has been published by Barbier *et al.* (1979).

**Experimental**

To a solution of  $[Cp^*Fe(MeCN)_3]PF_6$  (40 mg, 0.087 mmol) in dry MeCN was added  $PPh_2(CH_2)_2NH_2$  (20 mg, 0.087 mmol) and the solution was stirred at 20 °C for 16 h. The solvent was removed *in vacuo*, the residue was fractionally washed with dry hexane, Et<sub>2</sub>O, Et<sub>2</sub>O/THF (1:1), THF and THF/MeCN (3:1) over a plug of celite. The last purple fraction was kept and stored at -40 °C to give purple prismatic crystals of  $\{Cp^*Fe(MeCN)[Ph_2P(CH_2)_2NH_2]\}PF_6 \cdot THF$  (14 mg, 36% yield).

**Refinement**

For all hydrogen atoms the positions were calculated according to geometrical criteria. During the refinement the hydrogen atoms were allowed to shift with the preceding atoms. In the case of the methyl groups the torsion angles were allowed to refine. The isotropic displacement parameters were set as 1.2 times (1.5 for methyl) the equivalent isotropic displacement parameters of the preceding atoms. The  $PF_6^-$  anion was refined with two alternative orientations with occupancies 0.779 (7) and 0.221 (7). In order to stabilize the octahedral geometry during the refinement all equivalent bonding or nonbonding interatomic distances were restrained to be equal within a standard deviation of 0.03 Å.

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.045$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.115$	H-atom parameters constrained
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0463P)^2 + 3.1534P]$
7357 reflections	where $P = (F_o^2 + 2F_c^2)/3$
410 parameters	$(\Delta/\sigma)_{\text{max}} = 0.001$
357 restraints	$\Delta\rho_{\text{max}} = 0.48 \text{ e \AA}^{-3}$
	$\Delta\rho_{\text{min}} = -0.52 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations

between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
