Received 27 June 2011; accepted 29 June 2011

Key indicators: single-crystal X-ray study;  $T = 297\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$ ;  $R$  factor = 0.039;  $wR$  factor = 0.119; data-to-parameter ratio = 28.4.

In the title compound,  $\text{C}_{16}\text{H}_{18}\text{N}_2\text{O}_2\text{S}$ , the piperidine ring adopts a chair conformation. The central 4-thiazolidinone ring makes dihedral angles of 12.01 (7) and 51.42 (9) $^\circ$ , respectively, with the benzene ring and the least-squares plane of the piperidine ring. An intramolecular  $\text{C}-\text{H}\cdots\text{S}$  hydrogen bond stabilizes the molecular structure and generates an  $S(6)$  ring motif. In the crystal, molecules are linked into a tape along the  $c$  axis by intermolecular  $\text{C}-\text{H}\cdots\text{O}$  hydrogen bonds.

### (5E)-5-(4-Methoxybenzylidene)-2-(piperidin-1-yl)-1,3-thiazol-4(5H)-one

H.-K. Fun, C. S. Yeap, P. L. Lobo, D. J. Prasad and B. Poojary

#### Comment

4-Thiazolidinone ring system is a core structure in various synthetic compounds which display a broad spectrum of biological activities (Lesyk & Zimenkovsky, 2004) including an anticancer effect (Lesyk *et al.*, 2007; Havrylyuk *et al.*, 2009). Mechanisms of 4-thiazolidinones and related heterocycles antitumor activity may be associated with the affinity to anticancer bio-targets, such as phosphatase of a regenerating liver (PRL-3) (Ahn *et al.*, 2006; Park *et al.*, 2008) and non-membrane protein tyrosine phosphatase (SHP-2) (Geronikaki *et al.*, 2008). 5-Arylidene derivatives were previously shown as the most active group of compounds with the anticancer activity among a large pool of 4-azolidone derivatives and analogs (Zimenkovsky *et al.*, 2005). This prompted us to synthesize title compound (I).

The central 4-thiazolidinone ring makes dihedral angles of 12.01 (7) and 51.42 (9) $^{\circ}$ , respectively, with the benzene ring and the least-squares plane of piperidine ring. The piperidine ring adopts a chair conformation. An intramolecular C5—H5A $\cdots$ S1 hydrogen bond (Table 1) stabilizes the molecular structure and generates an *S*(6) ring motif (Fig. 1; Bernstein *et al.*, 1995). In the crystal structure, the molecules are linked into a tape along the *c* axis by intermolecular C16—H16A $\cdots$ O1 and C2—H2A $\cdots$ O1 hydrogen bonds (Table 1 and Fig. 2).

#### Experimental

An equimolar mixture of 2-(piperidin-1-yl)-1,3-thiazol-4(5H)-one, anisaldehyde and sodium acetate in acetic acid was refluxed for 2 hrs. The product formed was filtered, washed, dried and re-crystallized from ethanol.

#### Refinement

All hydrogen atoms were positioned geometrically (C—H = 0.93–0.97 Å) and refined using a riding model, with  $U_{\text{iso}}(\text{H})$  = 1.2 or  $1.5U_{\text{eq}}(\text{C})$ . A rotating-group model were applied for methyl group.

#### Figures

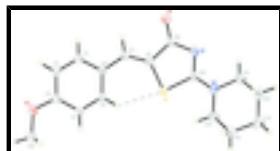

Fig. 1. The molecular structure of the title compound, with atom labels and 30% probability ellipsoids for non-H atoms. Hydrogen bonds (dashed lines) are shown.

## supplementary materials

---

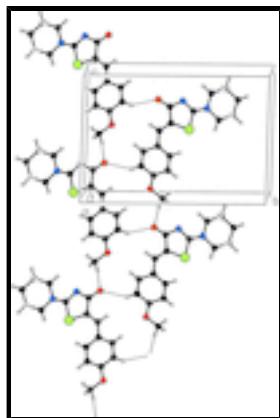

Fig. 2. The crystal packing of the title compound, showing the molecules linked along the *c* axis. Hydrogen bonds (dashed lines) are shown.

#### Data collection

Bruker APEXII DUO CCD area-detector diffractometer	5432 independent reflections
Radiation source: fine-focus sealed tube graphite	4148 reflections with $I > 2\sigma(I)$
$\varphi$ and $\omega$ scans	$R_{\text{int}}$ = 0.023
Absorption correction: multi-scan ( <i>SADABS</i> ; Bruker, 2009)	$\theta_{\text{max}} = 32.6^\circ$ , $\theta_{\text{min}} = 2.3^\circ$
$T_{\text{min}} = 0.877$ , $T_{\text{max}} = 0.950$	$h = -12 \rightarrow 12$
20021 measured reflections	$k = -25 \rightarrow 25$
	$l = -17 \rightarrow 18$

#### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.039$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.119$	H-atom parameters constrained

$S = 1.02$	$w = 1/[\sigma^2(F_o^2) + (0.0606P)^2 + 0.2092P]$
	where $P = (F_o^2 + 2F_c^2)/3$
5432 reflections	$(\Delta/\sigma)_{\max} = 0.001$
191 parameters	$\Delta\rho_{\max} = 0.31 \text{ e } \text{\AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.17 \text{ e } \text{\AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
