Received 7 June 2011; accepted 29 June 2011

Key indicators: single-crystal X-ray study; $T = 296\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.007\text{ \AA}$; R factor = 0.031; wR factor = 0.101; data-to-parameter ratio = 10.5.

The title compound, $\text{C}_{14}\text{H}_{12}\text{N}_2\text{O}_4\text{Se}_2$, is not chiral, but the molecules assume a chiral conformation in the solid state and crystallize as an aggregate. The central $\text{C}-\text{Se}-\text{Se}-\text{C}$ torsion angle is $90.4(2)^\circ$, while the two $\text{Se}-\text{Se}-\text{C}-\text{C}$ fragments assume *gauche* conformations with values of $-59.4(5)$ and $67.5(4)^\circ$. The dihedral angle between the two benzene rings is $80.74(14)^\circ$.

1,2-Bis(4-nitrobenzyl)diselane

H. Zhou, S.-Y. Ou, R.-A. Yan and J.-Z. Wu

Comment

Selenium is an important nutritional trace element involved in different physiological functions with antioxidative, anti-tumoral and chemopreventive properties (Jung *et al.*, 2010). Synthetic organoselenium compounds are less toxic and more chemopreventive than inorganic selenium compounds and natural organoselenums. This is the reason why they have attracted our interest. The title compound assumes a chiral conformation in the solid state (Figure 1). The dihedral angle between the two benzene rings of the molecule is 80.74 (14) $^{\circ}$. The C8—Se2—Se1—C1 torsion angle is 90.4 (2) $^{\circ}$, while the Se2—Se1—C1—C2 and Se1—Se2—C8—C9 torsion angles are -59.4 (5) and 67.5 (4), respectively. All bond lengths and angles are similar to those in related structures (Fuller *et al.*, 2010; Hua *et al.*, 2010; Lari *et al.*, 2009).

Experimental

To a vigorously stirred mixture of selenium powder (2.00 g, 25 mmol) and water (50 ml), sodium borohydride (0.95 g, 25 mmol) was added at 0 °C. The mixture was warmed to room temperature and stirred for 2 h. 1-(bromomethyl)-4-nitrobenzene (5.35 g, 25 mmol) was added and stirred for 2 h. O₂ was passed through the solution slowly for 2 h (Saravanan *et al.* 2003). The mixture was extracted with ethyl acetate (200 ml) and washed three times with water (50 ml \times 3). The obtained organic layer was dried over MgSO₄ overnight. The organic residue was further purified by silica gel column using dichloromethane as eluent. The solvent was then evaporated and the solid residue was recrystallized from CH₃OH to give the product as yellow crystals (yield: 4.83 g, 90%).

Refinement

Carbon-bound H atoms were positioned geometrically and treated as riding on their C atoms, with C—H distances of 0.93 Å (aromatic) and 0.97 Å (CH₂) and were refined with $U_{\text{iso}}(\text{H})=1.2U_{\text{eq}}(\text{C})$.

Figures

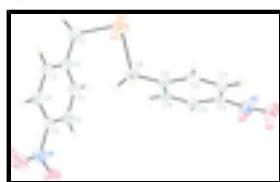

Fig. 1. Molecular structure of the title compound. Displacement ellipsoids are drawn at the 30% probability level.

$D_x = 1.848 \text{ Mg m}^{-3}$

supplementary materials

$M_r = 430.18$	Cu $K\alpha$ radiation, $\lambda = 1.5418 \text{ \AA}$
Orthorhombic, $P2_12_12_1$	Cell parameters from 2222 reflections
$a = 5.88324 (14) \text{ \AA}$	$\theta = 3.1\text{--}62.7^\circ$
$b = 14.3571 (3) \text{ \AA}$	$\mu = 6.17 \text{ mm}^{-1}$
$c = 18.3012 (4) \text{ \AA}$	$T = 296 \text{ K}$
$V = 1545.83 (6) \text{ \AA}^3$	Prism, metallic yellow
$Z = 4$	$0.3 \times 0.09 \times 0.09 \text{ mm}$
$F(000) = 840$	

Data collection

Agilent Xcalibur Gemini Ultra diffractometer	2098 independent reflections
Radiation source: Enhance Ultra (Cu) mirror	2015 reflections with $I > 2\sigma(I)$
Detector resolution: 16.0288 pixels mm^{-1}	$R_{\text{int}} = 0.017$
ω scans	$\theta_{\text{max}} = 62.8^\circ, \theta_{\text{min}} = 5.7^\circ$
Absorption correction: multi-scan (<i>CrysAlis PRO</i> ; Agilent, 2010)	$h = -6 \rightarrow 6$
$T_{\text{min}} = 0.546, T_{\text{max}} = 1.000$	$k = -14 \rightarrow 16$
3179 measured reflections	$l = -20 \rightarrow 20$

Refinement

Refinement on F^2	Secondary atom site location: difference Fourier map
Least-squares matrix: full	Hydrogen site location: inferred from neighbouring sites
$R[F^2 > 2\sigma(F^2)] = 0.031$	H-atom parameters constrained
$wR(F^2) = 0.101$	$w = 1/[\sigma^2(F_o^2) + (0.080P)^2]$ where $P = (F_o^2 + 2F_c^2)/3$
$S = 1.02$	$(\Delta/\sigma)_{\text{max}} = 0.002$
2098 reflections	$\Delta\rho_{\text{max}} = 0.50 \text{ e \AA}^{-3}$
199 parameters	$\Delta\rho_{\text{min}} = -0.50 \text{ e \AA}^{-3}$
0 restraints	Absolute structure: Flack (1983), 659 Friedel pairs
Primary atom site location: structure-invariant direct methods	Flack parameter: $-0.02 (4)$

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
