Received 29 June 2011; accepted 15 July 2011

Key indicators: single-crystal X-ray study; $T = 298\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.002\text{ \AA}$;
 R factor = 0.041; wR factor = 0.118; data-to-parameter ratio = 14.7.

The title pyrrole derivative, $\text{C}_{12}\text{H}_{17}\text{NO}_4$, consists of a pyrrole ring with two diagonally attached methoxycarbonyl groups and two diagonally attached ethyl groups. The two carbonyl groups are approximately in the same plane as the pyrrole ring, making dihedral angles of $3.50(19)$ and $6.70(19)^\circ$. In the crystal, adjacent molecules are assembled into dimers in a head-to-head mode by pairs of intermolecular $\text{N}-\text{H}\cdots\text{O}$ hydrogen bonds.

Dimethyl 3,5-diethyl-1*H*-pyrrole-2,4-dicarboxylate

G.-F. Lu, W.-S. Lin, W.-H. Zhu and Z.-P. Ou

Comment

Polysubstituted pyrroles have been paid much attention because of their wide application in the preparation of porphyrin (Trofimov *et al.*, 2004), corrole (Guillard *et al.*, 2001), and as monomers for polymer chemistry (Brockmann & Tour, 1995). In particular, 2-(alkoxycarbonyl)pyrrole derivatives have attracted intense interest in the design and synthesis of functional materials (Fan *et al.*, 2008). The title compound was synthesized as a precursor to corrole compounds.

As shown in Fig. 1, the compound has a five-membered pyrrole ring as skeleton and four substituents. Two diagonally related methoxycarbonyl groups and two diagonally related ethyl substituents are attached to the pyrrole ring. Pairs of intermolecular N1—H1n···O4ⁱ (symmetry code i: -x + 1, -y, -z + 1) hydrogen bonds assemble adjacent molecules in a head-to-head manner, as shown in Fig. 2. All bond distances are in the normal range for this type of compound, as reported by Yamamoto *et al.* (1986).

Experimental

The title compound was synthesized from methyl 3-oxopentanoate by a Knorr-type reaction according to the method reported by Ou *et al.* (2009). Single crystals were grown from ethyl alcohol by slow evaporation.

Refinement

All the non-hydrogen atoms were refined anisotropically by full-matrix least-squares calculations on F². All the H atoms expect H1n were placed in calculated positions with C—H distances of 0.93 and 0.96 %A, and were refined using a riding model with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$. H1n was found in a difference map, and included using a riding model with a bond length restrained to 0.84 (1) Å and $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{N})$.

Figures

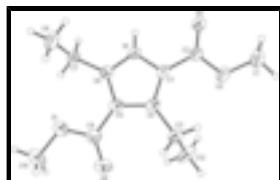

Fig. 1. Molecular structure of the title compound. Displacement ellipsoids are drawn at the 30% probability level.

Primary atom site location: structure-invariant direct
methods Extinction coefficient: 0.110 (8)

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
