Received 14 July 2011; accepted 17 July 2011

Key indicators: single-crystal X-ray study;  $T = 100\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.008\text{ \AA}$ ;  $R$  factor = 0.030;  $wR$  factor = 0.079; data-to-parameter ratio = 19.3.

The asymmetric unit of the title compound,  $\text{C}_{16}\text{H}_{19}\text{N}_2^+ \cdot \text{I}_3^-$ , contains a (*E*)-2-[4-(dimethylamino)styryl]-1-methylpyridinium cation and half each of two triiodide anions. The complete triiodide anions are each generated by inversion symmetry. The planar cation has all of its eighteen non-H atoms situated on a mirror plane. In the crystal, the cations are stacked along the  $b$  axis by  $\pi-\pi$  interactions with a centroid–centroid distance of  $3.5757(13)\text{ \AA}$ . The triiodide anions are located between the cations. The crystal structure is further consolidated by short C···C [3.322 (9)–3.3952 (19)  $\text{\AA}$ ] contacts.

### (E)-2-[4-(Dimethylamino)styryl]-1-methylpyridinium triiodide

**H.-K. Fun, K. Chanawanno and S. Chantrapromma**

#### Comment

Pyridinium halide salts, generally possess surface active and interesting antimicrobial properties. They contain reactive functional groups covalently bound to the long hydrophobic chain and can exhibit biological activity (Fisicaro *et al.*, 1990; Chanawanno *et al.*, 2010). It has been proven that one of the factors which control their antimicrobial activity is the presence of anions in the compounds. In the work done by Pernak and coworkers, it was shown that the various anion types can exhibit different antimicrobial activities (Pernak *et al.*, 2001). As our ongoing research is aimed at enhancing the antimicrobial activity of pyridinium salts, we have synthesized pyridinium salts with various anions in order to investigate the relationship between the types of anion and their antimicrobial properties. In the course of this work, the title compound (I) was synthesized and its crystal structure is reported here.

Fig. 1 shows the molecular structure of the title compound (I); the asymmetric unit consists of a  $C_{16}H_{19}N_2^+$  cation and two half- $I_3^-$  anions. The complete molecule of one triiodide anion (I2A) is generated by a crystallographic symmetry centre  $1 - x, y, -z$  whereas the other (I4A) is by  $1 - x, y, 1 - z$ . The cation is 100% planar as all its eighteen non-hydrogen atoms lie on a mirror plane,  $x, 0, z$ . One H atom of each of its three methyl groups at C14, C15 and C16 also lies in the mirror plane. The cation exists in an *E* configuration with respect to the C6=C7 double bond [1.327 (8) Å] and the torsion angles C5–C6–C7–C8 = 180.000 (3)°. The bond lengths (Allen *et al.*, 1987) and angles in (I) are in normal ranges and comparable to those found in related structures (Chantrapromma *et al.*, 2010; Zhang *et al.*, 2008).

In the crystal packing (Fig. 2) the cations are stacked along the *b* axis by  $\pi \cdots \pi$  interactions with the distances  $Cg_1 \cdots Cg_2 = 3.5757$  (13) Å (symmetry codes:  $1/2 - x, -1/2 + y, 2 - z; 1/2 - x, 1/2 + y, 2 - z; 1/2 - x, -1/2 - y, 2 - z$  and  $1/2 - x, 1/2 - y, 2 - z$ );  $Cg_1$  and  $Cg_2$  are the centroids of the C1–C5/N1 and C8–C13, respectively. Triiodide anions are located in the interstitials of the cations. The crystal structure is further consolidated by these  $\pi \cdots \pi$  interactions and short C–C [3.322 (9)–3.3952 (19) Å] contacts.

#### Experimental

The title compound was synthesized by mixing a solution of (E)-2-[4-(dimethylamino)styryl]-1-methylpyridinium iodide (Zhang *et al.*, 2008) (0.20 g, 0.55 mmol) in hot methanol (50 ml) and a solution of CuI<sub>2</sub> (0.17 g, 0.55 mmol) in hot methanol (30 ml). The mixture was stirred for half an hour and then left at room temperature. The title compound was formed as a red solid after 2 days. Orange needle-shaped single crystals suitable for x-ray structure determination were obtained by recrystallization from ethanol by slow evaporation of the solvent at ambient temperature over several days, *M.p.* >573 K.

## Refinement

All H atoms were placed in calculated positions with  $d(C—H) = 0.95 \text{ \AA}$ ,  $U_{\text{iso}}=1.2U_{\text{eq}}(\text{C})$  for aromatic and CH and  $0.96 \text{ \AA}$ ,  $U_{\text{iso}} = 1.2U_{\text{eq}}(\text{C})$  for  $\text{CH}_3$  atoms. The highest residual electron density peak is located at  $0.92 \text{ \AA}$  from I3 and the deepest hole is located at  $0.66 \text{ \AA}$  from C16.

## Figures

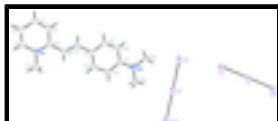

Fig. 1. The asymmetric unit of (I) showing 50% probability displacement ellipsoids and the atom-numbering scheme. Atoms I2A and I4A were generated by symmetry codes  $1 - x, y, -z$  and  $1 - x, y, 1 - z$ , respectively whereas one of the three H atoms on each of the three methyl groups are generated by symmetry code  $x, -y, z$ .

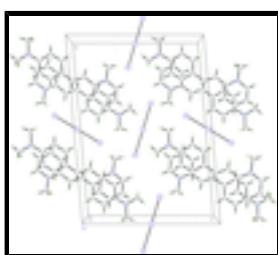

Fig. 2. The crystal packing of (I) viewed along the  $b$  axis.

## (E)-2-[4-(Dimethylamino)styryl]-1-methylpyridinium triiodide

### Crystal data

$\text{C}_{16}\text{H}_{19}\text{N}_2^+\cdot\text{I}_3^-$	$F(000) = 1152$
$M_r = 620.03$	$D_x = 2.178 \text{ Mg m}^{-3}$
Monoclinic, $C2/m$	Melting point $> 537 \text{ K}$
Hall symbol: -C 2y	Mo $K\alpha$ radiation, $\lambda = 0.71073 \text{ \AA}$
$a = 19.8760 (3) \text{ \AA}$	Cell parameters from 2484 reflections
$b = 6.6126 (1) \text{ \AA}$	$\theta = 1.4\text{--}28.0^\circ$
$c = 14.4421 (2) \text{ \AA}$	$\mu = 4.96 \text{ mm}^{-1}$
$\beta = 95.107 (1)^\circ$	$T = 100 \text{ K}$
$V = 1890.62 (5) \text{ \AA}^3$	Needle, orange
$Z = 4$	$0.45 \times 0.15 \times 0.04 \text{ mm}$

### Data collection

Bruker APEX DUO CCD area-detector diffractometer	2484 independent reflections
Radiation source: sealed tube graphite	2263 reflections with $I > 2\sigma(I)$
$\varphi$ and $\omega$ scans	$R_{\text{int}} = 0.030$
Absorption correction: multi-scan ( <i>SADABS</i> ; Bruker, 2009)	$\theta_{\text{max}} = 28.0^\circ, \theta_{\text{min}} = 1.4^\circ$
$T_{\text{min}} = 0.212, T_{\text{max}} = 0.838$	$h = -26 \rightarrow 26$
	$k = -8 \rightarrow 8$

16143 measured reflections

 $l = -19 \rightarrow 18$ *Refinement*

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.030$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.079$	H-atom parameters constrained
$S = 1.04$	$w = 1/[\sigma^2(F_o^2) + (0.0387P)^2 + 13.6577P]$ where $P = (F_o^2 + 2F_c^2)/3$
2484 reflections	$(\Delta/\sigma)_{\text{max}} = 0.001$
129 parameters	$\Delta\rho_{\text{max}} = 1.74 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\text{min}} = -0.60 \text{ e \AA}^{-3}$

*Special details*

**Experimental.** The crystal was placed in the cold stream of an Oxford Cryosystems Cobra open-flow nitrogen cryostat (Cosier & Glazer, 1986) operating at 100.0 (1) K.

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
