Received 14 August 2011; accepted 24 August 2011

Key indicators: single-crystal X-ray study;  $T = 296$  K; mean  $\sigma(C-C) = 0.006$  Å;  $R$  factor = 0.025;  $wR$  factor = 0.053; data-to-parameter ratio = 13.4.

In the centrosymmetric binuclear title complex,  $[Dy_2(C_9H_9O_3)_6(C_{12}H_8N_2)_2]$ , the two  $Dy^{III}$  ions are linked by four 2-phenoxypropionate ( $L$ ) groups through their bi- and tridentate bridging modes. Each  $Dy^{III}$  ion is nine-coordinated by one 1,10-phenanthroline molecule, one bidentate carboxylate group and four bridging carboxylate groups in a distorted  $DyN_2O_7$  monocapped square-antiprismatic geometry. The title compound is isotypic with its terbium-containing analogue.

**Comment**

As part of our ongoing studies of 2-phenoxypropionic acid complexes (Shen *et al.*, 2011) we describe a new Dy<sup>III</sup> complex.

The structure of the title compound (1) is a dinuclear dysprosium complex with Dy—Dy separation of 3.9857 (3) Å. The structure of the complex (Fig. 1) reveals that the molecule contains six *L*, two phen molecules and two Dy<sup>III</sup> ions. Each Dy(III) ion is coordinated to nine atoms, of which five oxygen atoms are from the bridging carboxylates, two oxygen atoms from the bidentate chelating carboxylate group, and two nitrogen atoms from a 1,10-phenanthroline molecule. The *L* ligands are coordinated to the Dy<sup>III</sup> ions in three different modes: chelating, bridging and bridging tridentate. The analysis of structural features indicates that the central Dy(III) ion adopts a distorted monocapped square antiprism geometry (Fig. 2). The Dy—O distances are all within the range 2.3252 (18)–2.622 (2) Å, and the Dy—N distances range from 2.518 (2)–2.594 (2) Å, all of which are within the range of those of other nine-coordinated Dy<sup>III</sup> complexes with carboxylic donor ligands and 1,10-phenanthroline (Liu *et al.*, 2010). The selected bond lengths and angles for complex 1 are listed in Table 1. In addition, there are no classical hydrogen bonds in the crystal structure, because good hydrogen bond donors are absent. The most significant intermolecular interactions are C—H $\cdots$ O hydrogen bonds (Table 2) and weak  $\pi\cdots\pi$  aromatic interactions from phen molecules and aromatic rings of the *L* ligands.

**Experimental**

Reagents and solvents used were of commercially available quality and without purified before using. 2-phenoxypropionic acid (1.5 mmol), Dy(NO<sub>3</sub>)<sub>3</sub>·5H<sub>2</sub>O (0.5 mmol) and 1,10-phenanthroline (0.5 mmol) were dissolved in 20 ml ethanol, then 10 ml water was added to the above solution. The mixed solution was stirred for 12 h at room temperature. At last, deposit was filtered out and the colourless solution was kept in the open air. Colourless blocks of (I) were obtained after several days.

**Refinement**

The structure was solved by direct methods and successive Fourier difference synthesis. The H atoms bonded to C and N atoms were positioned geometrically and refined using a riding model [aliphatic C—H = 0.96 Å ( $U_{\text{iso}}(\text{H}) = 1.5U_{\text{eq}}(\text{C})$ ), aromatic C—H = 0.93 Å ( $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ )].

Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.025$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.053$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0204P)^2 + 2.0937P]$
6224 reflections	where $P = (F_o^2 + 2F_c^2)/3$
463 parameters	$(\Delta/\sigma)_{\max} = 0.002$
0 restraints	$\Delta\rho_{\max} = 0.76 \text{ e } \text{\AA}^{-3}$
	$\Delta\rho_{\min} = -0.49 \text{ e } \text{\AA}^{-3}$

Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) *etc.* and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
