Received 5 August 2011; accepted 11 August 2011

Key indicators: single-crystal X-ray study;  $T = 296$  K; mean  $\sigma(\text{C}-\text{C}) = 0.002$  Å;  $R$  factor = 0.036;  $wR$  factor = 0.100; data-to-parameter ratio = 23.7.

In the crystal structure of the title compound,  $\text{C}_{10}\text{H}_{10}\text{N}^+\cdot\text{Cl}^-$ , the two components are connected *via*  $\text{N}-\text{H}\cdots\text{Cl}$  hydrogen bonds, forming a layer parallel to the *bc* plane.

## Naphthalen-1-aminium chloride

M. T. M. Al-Dajani, H. H. Adballah, N. Mohamed, M. Hemamalini and H.-K. Fun

### Comment

Naphthalene, a bicyclic aromatic compound, can be found environmentally as a constituent of coal tar, crude oil, and cigarette smoke. It is also used in chemical manufacturing as a chemical intermediate for many commercial products ranging from pesticides to plastics. Because of its widespread human exposure (Griego *et al.*, 2008), its toxicological properties have been the subject of numerous assessments. Of particular interest was an evaluation for the potential to induce tumors. Herein, we have present the crystal structure of naphthalen-1-ammonium chloride (I).

The asymmetric unit of title compound (I), consists of a protonated naphthalen-1-ammonium cation and a chloride anion as shown in Fig. 1. In the cation, the C1–C6 bonds are long [1.4260 (17) Å], while the C7–C8, C9–C10, C2–C3 and C4–C5 bonds are short, ranging from 1.357 (3) to 1.370 (2) Å. The remainder of the bonds, C8–C9, C1–C2, C1–C10, C3–C4, C5–C6, C6–C7 and C8–C9 have an intermediate length, ranging from 1.407 (2) to 1.420 (2) Å. This variation indicates that the  $\pi$  electrons are not fully delocalized over the whole nucleus of the naphthalene ring. This situation is similar to that observed in the crystal structure of naphthalene 2,3-dicarbonitrile (Pitchumony & Stoeckli-Evans, 2005). The naphthalene ring is essentially planar, with a maximum deviation of 0.007 (2) Å for atom C2. In the crystal structure, (Fig. 2), the ion pairs are connected *via* N—H $\cdots$ Cl hydrogen bonds (Table 1) forming layers parallel to the *bc*-plane.

### Experimental

In a round bottom flask, 25ml of toluene was mixed with 1-nitronaphthalene (0.01 mol, 1.5 g) with stirring. Iron powder (0.2 g) dissolved with 5 ml of hydrochloric acid was then added. The mixture was neutralized with sodium hydroxide solution. The blue precipitate formed was washed with alkaline water and then was dissolved in methanol at room temperature. After few days, blue needle-shaped crystals was formed by slow evaporation.

### Refinement

All hydrogen atoms were positioned geometrically (N—H = 0.89 Å and C—H = 0.93 Å) and were refined using a riding model, with  $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$ .

## Figures

Fig. 1. The asymmetric unit of the title compound, showing 50% probability displacement ellipsoids and the atom-numbering scheme. The intermolecular N—H...Cl hydrogen bond shown by a dashed line.

Fig. 2. The crystal packing of title compound (I), dashed lines represent hydrogen bonds. H atoms not involved in the hydrogen bond interactions are omitted for clarity.

$l = -17 \rightarrow 17$

*Refinement*

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.036$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.100$	H-atom parameters constrained
$S = 1.05$	$w = 1/[\sigma^2(F_o^2) + (0.0446P)^2 + 0.1614P]$
2612 reflections	where $P = (F_o^2 + 2F_c^2)/3$
110 parameters	$(\Delta/\sigma)_{\max} = 0.001$
0 restraints	$\Delta\rho_{\max} = 0.27 \text{ e } \text{\AA}^{-3}$
	$\Delta\rho_{\min} = -0.17 \text{ e } \text{\AA}^{-3}$

*Special details*

**Geometry.** All s.u.'s (except the s.u. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell s.u.'s are taken into account individually in the estimation of s.u.'s in distances, angles and torsion angles; correlations between s.u.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell s.u.'s is used for estimating s.u.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted R-factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional R-factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > 2\sigma(F^2)$  is used only for calculating R-factors(gt) etc. and is not relevant to the choice of reflections for refinement. R-factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and R-factors based on ALL data will be even larger.
