Key indicators: single-crystal X-ray study; $T = 113\text{ K}$; mean $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$;
 R factor = 0.055; wR factor = 0.127; data-to-parameter ratio = 18.9.

In the title molecule, $C_{25}H_{21}ClN_4OS$, the triazole ring forms dihedral angles of $47.9(2)$, $84.5(2)$ and $3.9(2)^\circ$ with the two phenyl rings and the chlorophenyl ring, respectively. The chlorophenyl ring, the triazole ring and the conjugative linker between the two aromatic rings are nearly coplanar with an r.m.s. deviation of $0.0483(2)\text{ \AA}$ and a maximum deviation of $0.0911(2)\text{ \AA}$.

Comment

In continuation of structural study of Mannich bases derivatives synthesized by reactions of the amino heterocycles and aromatic aldehydes in our group (Wang *et al.*, 2011), we present here the crystal structure of the title compound, (I).

The bond lengths and angles in compound (I) are found to have normal values comparable with those reported in the related 1,2,4-triazole- 5(4*H*)-thione derivatives (Al-Tamimi *et al.*, 1987; Fun *et al.* (2009); Tan *et al.* (2010); Wang *et al.*, 2011.). The C1 and C2 atoms in the 1,2,4-triazole ring show distorted C_{sp}^2 hybridization states with the bond angles of 101.84 (17) $^\circ$ (N1—C1—N3), 130.42 (15) $^\circ$ (N3—C1—S1), 110.66 (18) $^\circ$ (N2—C2—N3) and 126.39 (19) $^\circ$ (N2—C2—C25), which are similar to the reported triazole derivatives (Zhao *et al.*, 2010; Gao *et al.*, 2011). The 1,2,4-triazole ring forms the dihedral angles of 47.9 (2), 84.5 (2) and 3.9 (2) $^\circ$ with two phenyl rings and chlorophenyl rings, respectively. Three parts of chlorophenyl ring, triazole ring and the conjugative linker between this two armotic rings are nearly coplanar with an r.m.s. derivation of 0.0483 (2) \AA and maximum deviation of 0.0911 (2) \AA . The values of torsion angles N3—N4—C18—C19 [179.87 (17) $^\circ$], N4—C18—C19—C20 [173.6 (2) $^\circ$] and C2—N3—N4—C18 [173.88 (19) $^\circ$] also confirm this results.

Experimental

The title compound was synthesized with the reaction of 2-chlorobenzaldehyde (2.0 mmol) and 3-(4-amino-3-methyl-5-thioxo-4,5-dihydro-1*H*-1,2,4-triazol-1-yl)-1,3-diphenylpropan-1-one (2.0 mmol) by refluxing in ethanol. The reaction progress was monitored *via* TLC. The resulting precipitate was filtered off, washed with cold ethanol, dried and purified to give the target product as colorless solid in 78% yield. Crystals of (I) suitable for single-crystal X-ray analysis were grown by slow evaporation of a solution in chloroform-ethanol (1:1).

Refinement

H atoms were positioned geometrically and refined as riding (C—H = 0.95–1.00 \AA) and allowed to ride on their parent atoms, with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{parent})$ or $1.5U_{\text{eq}}(\text{parent})$.

Special details

Geometry. All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

Refinement. Refinement of F^2 against ALL reflections. The weighted R -factor wR and goodness of fit S are based on F^2 , conventional R -factors R are based on F , with F set to zero for negative F^2 . The threshold expression of $F^2 > \sigma(F^2)$ is used only for calculating R -factors(gt) etc. and is not relevant to the choice of reflections for refinement. R -factors based on F^2 are statistically about twice as large as those based on F , and R -factors based on ALL data will be even larger.
