Received 18 March 2011; accepted 16 August 2011

Key indicators: single-crystal X-ray study;  $T = 273\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.003\text{ \AA}$ ; disorder in main residue;  $R$  factor = 0.045;  $wR$  factor = 0.136; data-to-parameter ratio = 12.9.

In the crystal structure of the title osthol derivative,  $\text{C}_{18}\text{H}_{23}\text{NO}_4$ , molecules are linked by  $\text{N}-\text{H}\cdots\text{O}$  hydrogen bonds into an infinite chain running parallel to the  $c$  axis. The  $\text{CH}_3\text{CH}_2-$  atoms of the propionamide group are disordered over two sets of sites with refined occupancies of 0.689 (12) and 0.311 (12).

### Comment

Osthol, isolated from Imperatoria Ostruthium, exhibits anti-inflammatory activity in rats (Liu *et al.*, 2005) and is used in a variety of traditional medicinal preparations in India and China (Liu *et al.*, 1998). A few synthetic derivatives of osthol are used in hepatitis prevention (Okamoto *et al.*, 2007) since osthol specifically increases the glycosylation of the hepatitis antigen and secretion of hepatitis-B virus *in vitro* (Huang *et al.*, 1996). In this paper we report the synthesis and crystal structure of a semi-synthetic derivative of osthol. The compound was prepared by a Ritter reaction (Ritter & Minieri, 1948) and the resulting derivative contains a single bond instead of a double bond at the isoprenyl unit of osthol. The final product also contains a propionamide group (Fig. 1).

The bond lengths and bond angles of the present Osthol derivative are close to the reported values except for the bond angles at C7. The observed bond angles at C7 ( $C_8—C_7—C_{13} = 110.6(1)$ ° and  $C_8—C_7—C_{14} = 112.2(1)$ °) deviate significantly from the ideal values of 109.5(1) (Allen *et al.*, 1987). The corresponding bond angles of the parent Osthol molecule are 124.7(2)° and 120.5(2)° (Borowiak & Wolska (1989). The bond angle deviation at C7 is attributed to the attached propionamide group and the  $sp^2$  to  $sp^3$  hybridization change at C7 and C8 atoms. In the present structure the torsion angles  $C_{13}—C_7—C_8—C_9$  and  $C_{14}—C_7—C_8—C_9$  are -64.2(2)° and 58.4(2)°, respectively. The corresponding torsion angles in osthol are -1.61(2)° and -177.8(2)° (Borowiak & Wolska, 1989). The change in torsion angles is mainly due to the propionamide substitution at C7. C17 and C18 are disordered over two positions with refined occupancies of 0.69(1) and 0.31(1). The packing of the molecules is stabilized by the N1—H1N $\cdots$ O4 hydrogen bond, which forms an infinite chain in head to tail mode, running parallel to the c-direction (Fig. 2).

### Experimental

Propylnitrile was added to a solution of Osthol (100 mg) dissolved in benzene, and the reaction mixture was cooled at 0°C, followed by slow addition of sulfuric acid. The reaction mixture was stirred at room temperature for 2 to 3 hrs and was quenched after a complete disappearance of Osthol with a saturated solution of sodium bicarbonate. The final compound was extracted with ethyl acetate and dried over sodium sulfate. The compound was purified using column chromatography with 10% ethyl acetate in hexane as a mobile phase. Rod-shaped crystals were obtained using a slow-evaporation technique from a mixture of ethyl acetate and hexane.

### Refinement

The H atom bonded to N was freely refined. H atoms bonded to C were positioned geometrically ( $C—H = 0.93 - 0.98 \text{ \AA}$ ) and allowed to ride on their parent atoms, with  $U_{\text{iso}}(\text{H}) = 1.5 U_{\text{eq}}(\text{C})$  for methyl H and  $1.2 U_{\text{eq}}(\text{C})$  for other H atoms. The C17 and C18 atoms are disordered over two positions (C17A/C17B and C18A/C18B) with refined occupancies of 0.69(1) and 0.31(1).

234 parameters	$\Delta\rho_{\max} = 0.16 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.13 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
