Key indicators: single-crystal X-ray study;  $T = 296\text{ K}$ ; mean  $\sigma(\text{C}-\text{C}) = 0.004\text{ \AA}$ ;  $R$  factor = 0.039;  $wR$  factor = 0.098; data-to-parameter ratio = 12.1.

The title complex,  $[\text{Co}(\text{C}_{12}\text{H}_{10}\text{N}_6)_2(\text{H}_2\text{O})_2](\text{C}_8\text{H}_4\text{NO}_6)_2$ , is composed of a mononuclear cobalt(II) cation and two 3-carboxy-5-nitrobenzoate anions for charge balance. In the cation, the  $\text{Co}^{II}$  atom is six-coordinated in a distorted octahedral geometry. It bonds to two O atoms of two water molecules, and two pairs of N atoms from two 4-amino-3,5-bis(2-pyridyl)-4H-1,2,4-triazole molecules, which behave as bidentate chelating ligands. There are intramolecular  $\text{N}-\text{H}\cdots\text{N}$  hydrogen bonds in the cation. In the crystal, there are a number of intermolecular  $\text{N}-\text{H}\cdots\text{O}$  and  $\text{O}-\text{H}\cdots\text{O}$  hydrogen bonds, as well as intermolecular  $\pi-\pi$  stacking interactions [centroid-centroid distances = 3.657 (2) and 3.847 (2)  $\text{\AA}$ ], that link the molecules into two-dimensional networks lying parallel to the  $ab$  plane. The presence of  $\text{C}-\text{H}\cdots\text{O}$  interactions leads to the formation of a three-dimensional network.

**trans-Bis[4-amino-3,5-bis(2-pyridyl)-4H-1,2,4-triazole- $\kappa N^3$ ]diaquacobalt(II) bis(3-carboxy-5-nitrobenzoate)**

**X. Wang, C.-F. Shao and C.-P. Li**

**Comment**

1,2,4-triazole and its derivatives are an important class of ligands used as building tectons in constructing coordination complexes (Klingele *et al.*, 2009; Shao *et al.*, 2004; Huang *et al.*, 2011). In particular, pyridyl-decorated triazole ligands are extensively studied, for example 4-amino-3,5-bis(4-pyridyl)-4H-1,2,4-triazole and 4-amino-3,5-bis(3-pyridyl)-4H-1,2,4-triazole, by us (Du *et al.*, 2007; 2008) and other groups (He *et al.*, 2010; Li, *et al.* 2010). In the published articles, such series of ligands successfully behave as not only the extended exo-bidentate linkers with the terminal pyridyl groups but also as the promoter of a coordinative cycle with the central triazole upon metalation (Li, *et al.* 2010). Toward this direction, the analogous ligand 4-amino-3,5-bis(2-pyridyl)-4H-1,2,4-triazole (2-bpt) exhibits different conformations and coordination modes, and has received our attention (Guo *et al.* 2011). In continuation of our work in this field we report on the crystal structure of the title cobalt(II) complex.

The molecular structure of title complex is illustrated in Fig. 1. In the cation  $[Co(2-bpt)_2(H_2O)_2]^{2+}$ , the 2-bpt ligands show a bidentate mode, bonding to atom Co1 through atoms N1, N2 and N7, N8, in a *trans* arrangement. The Co1 atom is also coordinated to a pair of water molecules through the O atoms O1 and O2. The cobalt atom shows a distorted octahedral coordination sphere. The two 3-carboxy-5-nitrobenzoates are isolated in a discrete mode for charge balance. Within the cation  $[Co(2-bpt)_2(H_2O)_2]^{2+}$ , there are two intramolecular N–H···N bonds involving the amino and the 2-pyridyl groups in the 2-bpt ligands (Table 1).

In the crystal, intermolecular O–H···O hydrogen bonds between the water ligand and discrete 3-carboxy-5-nitrobenzoates interlink these molecules into a one-dimensional chain motif. Furthermore, adjacent chains are interconnected by N–H···O hydrogen bonds between the 2-bpt and 3-carboxy-5-nitrobenzoate, and O–H···O hydrogen bonds between the 3-carboxy-5-nitrobenzoates, to form extended two-dimensional networks (Table 1 and Fig. 2). In addition, a number of  $\pi\cdots\pi$  stacking interactions, involving symmetry related coordinated pyridine rings, are found to further reinforce the two-dimensional supramolecular pattern [ $Cg1\cdots Cg1^i$  3.847 (2) Å, perpendicular separation 3.534 (1) Å, with slippage of 1.519 Å;  $Cg2\cdots Cg2^i$  3.657 (2) Å, perpendicular separation 3.495 (1) Å, slippage 1.077 Å; where  $Cg1$  is the centroid of ring (N1,C1-C5);  $Cg2$  is the centroid of ring (N7,C13-C17); symmetry code: 1-x, -y, -z]. There are also a number of C–H···O interactions present linking the two-dimensional networks to form a three-dimensional structure (Table 1).

**Experimental**

A mixture of 4-amino-3,5-bis(2-pyridyl)-1,2,4-triazole (2-bpt; 23.8 mg, 0.1 mmol), 5-nitroisophthalic acid (21.1 mg, 0.1 mmol),  $Co(NO_3)_2$  (18.3 mg, 0.1 mmol) in water (10 ml) was sealed in a Teflon-lined stainless steel vessel (20 ml). It was heated to 373 K in 24 h and then gradually cooled to room temperature at a rate of 5 °C/h. Red block-like crystals, suitable

---

for X-ray analysis, were obtained. Anal. Calc. for  $C_{40}H_{32}CoN_{14}O_{14}$ : C, 48.44; H, 3.25; N, 19.77%. Found: C, 48.32; H, 3.04; N, 19.85%.

## Refinement

All the H atoms were initially located in a difference Fourier map. The water and  $NH_2$  H atoms were then refined as riding atoms with  $U_{iso}(H) = 1.5U_{eq}(O,N)$ . The hydroxyl and C-bound H atoms were included in calculated positions and treated as riding atoms: O-H = 0.85 Å, N-H = 0.89 Å, and C-H = 0.93 Å, with  $U_{iso}(H) = k \times U_{eq}(O,N,C)$ , where  $k = 1.5$  for OH and  $NH_2$  H atoms, and  $k = 1.2$  for C-bound H-atoms.

## Figures

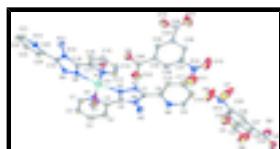

Fig. 1. Molecular structure of the title compound showing the numbering scheme, and displacement ellipsoids drawn at the 50% probability level [H-atoms have been omitted for clarity].

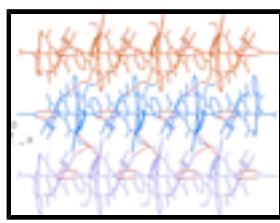

Fig. 2. A view along the c-axis of the two-dimensional network in the crystal of the title compound, formed via  $N-H\cdots O$  and  $O-H\cdots O$  hydrogen bonds (red dashed lines; see Table 1 for details).

$V = 2148.4 (13) \text{ \AA}^3$	

### Data collection

Bruker SMART CCD area-detector diffractometer	7532 independent reflections
Radiation source: fine-focus sealed tube graphite	5560 reflections with $I > 2\sigma(I)$ $R_{int} = 0.020$

$\varphi$ and $\omega$ scans	$\theta_{\max} = 25.0^\circ, \theta_{\min} = 1.5^\circ$
Absorption correction: multi-scan (SADABS; Sheldrick, 1996)	$h = -9 \rightarrow 9$
$T_{\min} = 0.876, T_{\max} = 0.953$	$k = -19 \rightarrow 14$
11079 measured reflections	$l = -21 \rightarrow 16$

### Refinement

Refinement on $F^2$	Primary atom site location: structure-invariant direct methods
Least-squares matrix: full	Secondary atom site location: difference Fourier map
$R[F^2 > 2\sigma(F^2)] = 0.039$	Hydrogen site location: inferred from neighbouring sites
$wR(F^2) = 0.098$	H-atom parameters constrained
$S = 1.03$	$w = 1/[\sigma^2(F_o^2) + (0.0395P)^2 + 0.4823P]$ where $P = (F_o^2 + 2F_c^2)/3$
7532 reflections	$(\Delta/\sigma)_{\max} = 0.001$
624 parameters	$\Delta\rho_{\max} = 0.19 \text{ e \AA}^{-3}$
0 restraints	$\Delta\rho_{\min} = -0.28 \text{ e \AA}^{-3}$

### Special details

**Geometry.** All e.s.d.'s (except the e.s.d. in the dihedral angle between two l.s. planes) are estimated using the full covariance matrix. The cell e.s.d.'s are taken into account individually in the estimation of e.s.d.'s in distances, angles and torsion angles; correlations between e.s.d.'s in cell parameters are only used when they are defined by crystal symmetry. An approximate (isotropic) treatment of cell e.s.d.'s is used for estimating e.s.d.'s involving l.s. planes.

**Refinement.** Refinement of  $F^2$  against ALL reflections. The weighted  $R$ -factor  $wR$  and goodness of fit  $S$  are based on  $F^2$ , conventional  $R$ -factors  $R$  are based on  $F$ , with  $F$  set to zero for negative  $F^2$ . The threshold expression of  $F^2 > \sigma(F^2)$  is used only for calculating  $R$ -factors(gt) etc. and is not relevant to the choice of reflections for refinement.  $R$ -factors based on  $F^2$  are statistically about twice as large as those based on  $F$ , and  $R$ -factors based on ALL data will be even larger.
